# PLANTER. SOUTHERN

Devoted to Agriculture, Horticulture, and the Household Arts.

Agriculture is the nursing mother of the Arts. | Tillage and Pasturage are the two breasts of the State.—Sully. -Xenophon.

FRANK. G. RUFFIN, EDITOR.

F. G. RUFFIN & N. AUGUST, PROP'RS.

Vol. XVI.

RICHMOND, AUGUST, 1856.

No. 8.

TO CHRISTOPHER QUANDARY.

DEAR CHRISTOPHER: -I have to acknowledge the receipt of your letter asking my advice about overseers-the management of your farm, and the best course to pursue, to enable you to pay your present debts. You also desire to know whether I think it wise or unwise for the agricultural class to purchase goods, &c., upon credit, and in anticipation of large crops and

high prices.

Rochefoucault has truly said "there is nothing of which we are so liberal as of advice" and that we may "give advice, but we cannot give conduct." My advice is not gratuitous, but offered at your request. Your father and myself were old friends. He died in 1850, (about the time you graduated at the University,) and through him you inherited a good estate. I learn from you that you reside upon this farm and that for the last five years you have been engaged in agricultural pursuits. I have lived longer than you, and as I sincerely desire the prosperity of all the agricultural community, I shall comply with your wishes. Educated young gentlemen cannot expect to become good managers instanter. Their ignorance of practical agriculture, and their want of experience have more frequently attracted my sympathy than excited my surprise. If any of the suggestions which I design to present, should prove of any service to you, I shall be fully compensated for addressing you.
If you

you have read the excellent editorial articles in recent numbers of the Southern Planter upon the duties and qualifications of overseers, you will not care much to read my views on the same subject. Referring you to those essays, a content myself with only a few observations on this topic. The supply of really good overseers is not adequate to the demand, and hence it often happens, that farmers are induced to employ, as overseers, men wholly incompe tent to discharge the duties ordinarily required. An overseer should possess discrimination and

verance. To these let him add sobriety and self-command. He should not delude himself with the notion that the political affairs of the country and the salvation of the confederacy imperatively require him to become a political partisan, or that the municipal affairs of his county will be entirely mismanaged unless he neglects the business of his employer and rides to every monthly, quarterly and circuit court to "hear the news" and "to see and be seen." He is paid for his time and services, and to the diligent performance of those services he should devote himself. He should push his business and not allow his business to push him. He should love and speak the truth, and remember that if he does not, his employer will soon detect and cease to respect him. He should maintain a proper discipline, but always ohserve justice and humanity. He should require fair and reasonable work, but carefully abstain from excessive labor, or improper exposure of his laborers during bad weather. He should strive to make good crops and at the same time improve the soil—attend faithfully and regularly to the horses, cattle, sheep, hogs, &c. Between him and his employer there should be courtesy always-consultation occasionallyfamiliarity at no time. It is the duty of the overseer to respect the wishes and execute the orders of his employer, whether the overseer approves of the orders and plans of said employer or otherwise.

But few overseers have sufficient maturity of judgment or requisite experience, before they are thirty years old, to be qualified to manage a large farm or superintend many hands; and after attaining the age of 45 to 50, their physical powers are impaired, and they are less fit for the energetic and prompt discharge of their duties. After deciding upon your plans, give orders, not to your negroes, but give directions to your overseer. Respect for him enjoins this course, and by its observance you will prevent conflict of orders and misunderstanding between judgment, a strong constitution and good yourself and overseer, as well as negroes Rehealth, industry, integrity, patience and perse-l gard with some distrust the flattering certifi-

and generous feelings have erred in recommending overseers, who, upon trial, have been found sadly deficient. Contracts with overwell acquainted with the Latin and planters should consult together and resolutely determine to postpone making contracts with overseers until August or September. The present practice is injurious to the farmers and planters, and beneficial only to such overseers as have really but little merit. If a new overseer moves to your farm on the 15th Nov. you ought to have by general acquiescence and established usage, until August or September to decide whether his management is such as to entitle him to a continuance for the next year. No overseer who wishes and intends to do his duty, and who is conscious of possessing proper qualifications need apprehend any difficulty in getting a good situation and reasonable compensation, by a postponement of the period for kind of legislation—except the passage of a making contracts as is here suggested.

to regard agriculture as a pursuit unworthy of you among the number) are taxed twice as the regular attention of a gentleman. Hence much by their idleness, three times as much by many of them were impoverished. Within the their pride, and four times as much by their last thirty years a great change in public senti- folly. Dismiss from your mind the thought of ment has taken place, and now the farmer or planter, who is too proud or too indolent to superintend his overseer and control the habits, reduce your expenditures, apply youraffairs of the farm, is more likely to excite ridi-self with augmented industry and zeal to the cule than win approbation. Do you not know, management of your farm and endeavor by all Christopher, that the eye of the master will do honest exertions to pay your debts as soon as more work than both his hands"—that "want of are does us more damage than the want of estate will take care of your estate and your knowledge," and that "not to superintend workmen is to leave them your purse open?" brance this simple truth. Remember that "he Remember that in many of the affairs of this who sells an acre of land sells an ounce of his world, men are not saved by faith, but by the

want of it.

cates and recommendations handed to you by for said house and furniture, the other fifthose who are candidates for employment as teen thousand having been borrowed of two overseers. Some farmers of very kind hearts or three friends, who require you to pay the seers are generally made in May or June, and overseers move 15th November. The farmers and modern history—with chemistry and mathematics. with natural and moral philosophy; in short, your head is a perfect storehouse of learning, yet cousin Christopher, excuse me for saying that after all "you are a bit of a goose." The comfortable house in which you were born and raised, and in which your father died, might, you thought, do very well for an "old fogy" like him, but was wholly unfit, as you believed, for "Young America." You have certainly made considerable "progress," but whether or not in the right road is exceedingly questionable. No wonder that you are found complaining because the last Legislature doubled the State taxes. Men, when much involved in debt, are prone to find fault with all bankrupt law. Our taxes have been doubled, Half a century ago, a majority of the wealthy planters of Virginia relied almost entirely upon the management of their overseers, and seemed taxes we submit to. Many persons (perhaps selling your inheritance and moving off to Texas, remain where you are, reform your credit." Debts are paid, not by despair, but ant of it.

You tell me that you are in debt, that you learned to appreciate the value of time. What are anxious, uneasy and unhappy; that you we call time enough, always proves little know not which to do, whether to sell half of enough. "Then plough deep while sluggards your negroes and thus pay your debts, or sell sleep, and you shall have corn to sell and to your land, pay your debts with the proceeds, keep." If you love life, then do not squander and then move with your wife, children and time, "for that is the stuff life is made of," as negroes to Texas; or whether it would be best poor Richard says. Rise early and devote seveto remain in Virginia, hold your property, and ral hours of every day (Sundays excepted) to try, by diligence and frugality, to discharge your farming operations. Your overseer and your pecuniary obligations. You say that the negroes seeing this improvement in your habits, estimated value of your land when you obtained will be encouraged and stimulated to perform possession was thirty thousand dollars, that their respective duties with greater fidelty and although the family mansion was comfortable zeal Inform your wife frankly and fully of and in good order, you thought it deficient in elegance and taste, that you took it down and sire to pay them as soon as you can, and ask built a new house which cost you ten thousand her in a kind manner, to abstain henceforward dollars and that when this house was completed, from buying so many costly silks, &c., from you and your wife went to New York and bought furniture to the amount of ten thousand dollars for your charming residence, that you have paid only five thousand dollars in fact rate with you in your laudable efforts to pay

your debts without selling your land or negroes. Besides this, you must abandon your love of locomotion, and cease your visits to Cape May, Saratoga, Niagara, and the Lakes. Your residence is entirely healthy throughout the year, and being in debt, you can urge no good reason why you should apply the proceeds of your crops to trips of recreation instead of to the payment of your just debts. If compelled by bad health to leave home during the summer, go to Old Point Comfort or to some of the Virginia Springs. No state in the Union surpasses Virginia in beauty and variety of scenery or in the number and efficacy of its mineral waters. Unless required by bad health to leave your home and business, remain at home. With home and business, remain at home. farmers, summer is an important and busy season, while the reverse is true in regard to the inhabitants of cities. It costs city people not much more to travel in summer than to live in town, as they always have to pay for their meats and vegetables, milk, butter, &c. Not so however with the farmer. But I am digressing and must return to my subject. Remember that there are no gains without pains, and that he who "rises late must trot all day, and and shall scarce overtake his business at night," as poor Richard says, and truly. To industry you must add common sense, if you wish to avoid shipwreck. Your father had a good share of common sense, but if I were to judge you by your \$10,000 dwelling and your \$10,000 worth of furniture, I should say, Christopher, that you had not an ounce, yea a grain of common sense. Do then try and acquire this essential kind of sense. Instead of acting like Don Quixote, follow the good example of your father. Be your income what it may, never allow your expenditures to exceed your income. Unless you learn to save as well as how to make money, you will keep your nose all you life to the grindstone and die not worth a groat at last. You must learn how to make large crops, you must exhibit your industry in making and saving them, your sagacity as to the time for selling them, and your economy in using the proceeds. Some verdant youths speak of economy as synonymous with parsimony. This absurdity may pass among juveniles and also among some extravagant young men. Economy is, in truth, as far removed from parsimony as from extravagance—the two last being extremes, and economy occupying middle and mutual ground. The prudent man likes economy—the miser delights in parsimony and the spendthrift in extravagance.

There are probably not more than fifty farmers in Virginia who would be justifiable—in consequence of their wealth—in spending \$20,000 in building and furnishing a country house. Your means certainly did not authorise such an expenditure. Have you forgotten that

"Vessels large may venture more, But little boats should keep near shore." Not content with the dimensions of a large frog you have nearly exploded in your abortive effort to rival the ox. You now find, as Poor Richard says, that "creditors have better memories than debtors." Unless you abandon your extravagant habits, you will find as poor Dick says, that "it is hard for an empty bag to stand upright" and that "Lying rides upon Debt's back." I will not however despair of you. You have a large share of pride but not of the right kind. Your pride is of the fashionable kind, and savors of the New York "cod-fish aristocracy"—a love of fine houses and costly furniture—fine clothes, new carriages, dear horses, diamonds, &c. These things have not brought happiness to you, and your last letter contains your acknowledgement of the fact. To keep up appearances and delude the public, you contracted debts and have been annoyed by duns. By reforming your habits and paying your debts, you will recover your former independence and cheerfulness. Duns will not then annoy, or debts disturb you. You will then feel better, breathe more freely and sleep sounder. The farmers and planters living around you will be gratified to see this change in your conduct, and will respect you more

Two pair of carriage horses, a buggy horse the benefit of yourself, wife and two children, is a larger number of pleasure horses than you ought to keep. I suggest that you sell at least three of these horses, and thereby lessen the tax upon your corn-house, and at the same time discharge a part of your liabilities. One pair of carriage horses and a riding horse besides, ought to suffice for you and family, and I doubt whether you would have had more than this number if you had not built a costly house and desired every thing to correspond. Retrenchment should be your motto. Don't forget, Christopher, that "a ploughman on his legs is higher than a gentleman on his knees," and when you think of little expenses, reflect, that "a small leak will sink a great ship." Your wife knows, or ought to know, that "always taking out of the meal-tub, and never putting in, soon comes to the bottom." If she, good soul, hints to you, that she would like for you to order five or six silk dresses for her, remind her that "silks and satins, scarlets and velvets put out the kitchen fire." Both of you have found out that "pride is as loud a beggar as

want, and a great deal more saucy."
You ought to keep a journal of all your receipts and expenditures. This can be done easily, and you will soon derive benefit from the habit. I have followed the practice for more than twenty years, and would respectfully recommend it to you and all other farmers. No man who will try the plan for one year will ever willingly abandon it. I beg you to adopt it without delay. Do not misunderstand me, Christopher. While I condemn your extrava-

gance and deplore your past follies, do not suppose for a moment that I wish you now to become a sordid miser and close your heart to every feeling of charity and generosity. Far, very far from it. I wish to see you avoid the character of a miser as well as that of spendthriftto convince you that without economy, as well as industry, you cannot pay your debts—to urge you to remain in Virginia, and exert your powers in elevating her agriculture-to induce you to cherish a proper self-respect, and seek an

honest independence.

You ask me whether I think farmers ought to buy goods, &c. upon credit, and in anticipa-tion of large crops and high prices. The practice is, I think, very reprehensible. As a general principle, farmers and planters ought not to buy upon credit, but adhere to the cash system. Young and inexperienced farmers, and especially those of a sanguine temperament, sometimes make ludicrous blunders, besides large crops which they certainly intended to make, and high prices which they resolved to obtain. The last few months have afforded many illustrations of the latter. Some farmers who were offered \$2 30 for their wheat, refused the offer, demanded \$3 per bushel, and finally accepted \$1 50. The amount of the crop is dependent upon many contingences, and varies from year to year, as well as the price. Hence the hazard and impropriety of contracting debts in anticipation of large crops and high prices. Some farmers make large crops by arithmetic, but are nevertheless surpassed by others who never like to cipher until after their crops are sold and the money paid. Whenever you see a man convince himself by arithmetical calculations that he will make large crops and sell them at high prices, be assured that he is par-tially deranged. The credit system has at different periods inflicted immense injury. For some time past, agricultural products have commanded good prices, and there are, no doubt, more farmers now dealing upon the cash system than formerly. Ere long, I trust, it will prevail almost universally. When that time arrives, we shall hear less said about "hard times" and going to Texas, Kansas, Missouri or the Moon.

I am sorry to say, Christopher, that there are several other farmers who have "progressed" in extravagance and fashionable follies nearly or quite as much as yourself. The sun has its dark spots, and it can excite no wonder, that the great agricultural class should exhibit a few peculiar specimens of humanity. Some few farmers refuse to expend their money to accomplish purposes plainly useful, in order that they may indulge their imaginary wants, or servilely obey the behests of fashion. A few illustrations may be given.

Mr. A. makes very good Tobacco, and is an

gars, has draw-bars instead of gates to the several fields of his plantation; acknowledges the superiority of gates, but says he cannot afford

to pay for them.

Mr. B. cannot tell one tune from another, but professes intense love for fashionable music.-So soon as Jenny Lind arrived in New York, Mr. B., his wife and daughters took the cars and soon reached the Astor House. Of course, they were enraptured by Jenny's unsurpassed and heavenly music. The ladies did not find any book-store in New York, but were compensated by the China stores and jewelry shops which they pronounced to be equally charming and splendid. The young ladies helped themselves freely to jewelry, but their considerate mother determined to spend her money usefully, so she bought a fine set of dinner China at one thousand dollars. This trip of pleasure cost Mr. B. only three thousand five hundred dollars. Mr. B. has no apple trees or peach trees upon contracting very large debts upon the faith of his farm, laments this, but says he will not submit to imposition and stoutly refuses to give 25 cents each for young trees. He and his family are fond of fruit, and in addition to all the fruit they beg from their poor neighbours, Mr. B. sends to town every winter and purchases ten barrels of Northern apples,

Mr. C. built a large dwelling-house five years ago, but it has no shutters and has never been painted, merely because he "has no money to spare." Last year he said he was resolved to have the finest equipage in his neighbourhood. Accordingly he went to Philadelphia where he bought a carriage for \$1,000, and then to New Jersey where he purchased a pair of fine trotters for another \$1,000. When he went North he saw so many painted houses along the route, that he thinks his house looks best without any paint at all, and that he will save his money

for some better purpose.

Mr. D. is unwilling to give \$30 for a cornsheller, although his negroes consume thirty bushels of meal a week. But he is willing enough and able enough to spend, and has actually paid five thousand dollars for the education and clothing of his two daughters during the three years these fashionable and accomplished young ladies attended a celebrated female school in Philadelphia. While there they attended the theatre and opera, acquired a su-perficial knowledge of French and Italian, learned to dance most beautifully and to play admirably upon the piano, guitar and harp. Unfortunately their knowledge of books is not extraordinary. The one says that the history of Robinson Crusoe, by the historian, David Hume, is the most interesting and valuable history recently published: the other maintains that the "Children of the Abbey" was never published until 1855, and is by far the most powerful novel ever written by the pious Wm. Cobbett of England! With the history of Virexcessive smoker, but thinks a pipe is not gen-ginia, they are as thoroughly acquainted as teel. He spends \$300 annually in Havana ci-with the interior of Japan. Their mother is

of the cares of housekeeping, but these charming girls are unwilling to submit to such low drudgery. They are too proud—think too as all the sons of Virginia belong to Virginia, highly of their social position—to condescend it is the duty of the Commonwealth to educate to learn how bacon is cured or cooked, or milk is churned. Of course, their dresses are all made in Philadelphia, and cost a large sum annually. Their father has a piece of flat land, which by an expenditure of fifty dollars, might be made fine meadow land. He makes no hay, buys several tons of Northern hay every spring for his horses, and declares that ditching is so expensive he cannot afford to pay his money for such work. Unwilling to be so extravagant as to give his cows anything more than straw during the winter, he goes without cream and milk during cold weather, and sends to the North for his butter. His cows gives him no milk, and he makes no butter from the 1st December to 15th April annually.

Mr. E. cannot spare any money to buy clover seed and plaster, although anxious to improve his land and appreciating clover and plaster very highly. He has, however, resolved to educate his son thoroughly, and therefore sent him to the University. He is allowed four hundred dollars a session to pay for books, board and tuition, and the kind-hearted father being solicitous that the son should avoid vulgar company, and move in the first circles, gives him \$400 for clothing and \$400 more for pocket money. The promising youth keeps a fine buggy and horse, flirts with the young ladies, gives nice suppers and entertains his numerous friends with excellent wine and cigars of the best flavor. He is quite popular and universally spothough his circulars are by no means flattering, his father (like Mr. Macawber) hopes something favorable will turn up, and that if his son fails to be President, he will, at least, become a Senator of the U.S.

Mr. F. avows himself to be an ardent friend of agricultural improvement, talks fluently and praises lime, bone dust and guano as absolutely indispensable for all farmers. For five years past, he has intended to buy freely of each, but he could not well afford it. His farm is in full view of the Blue Ridge, and his residence unusually healthy. His fortune was at one time large, but has been impaired by his inattention to business and by fondness for card playing, good dinners and good wines. He walks a little about his yard and garden daily, and rides over his farm once a week to see the overseer and enquire what has been done the preceding week. In June he is resolved to buy 20 tons of guano to sow with his wheat in October, but in July he borrows money of his commission merchant upon the faith of his new crop of

in delicate health and would like to be relieved less than \$10,000. He admires no other form of government so much as what he calls a parental government, and vigorously maintains that as all the sons of Virginia belong to Virginia, all of the white boys of the State. He advocates the largest liberty upon this subject, while avowing aristocratic and exclusive preferences generally. Denying his obligation to educate and provide for his children, he proposes to send three of his sons to the Military Institute and the other three to the University, provided he can enter them as State students.

Your family, Christopher, is small at present. but it is your duty to look to and provide for the future. You too may have six sons. Have you any moral right to squander your money in selfish and superfluous gratifications, and then call upon the State to educate your children at the expense of your fellow-citizens?

Some years ago, Mr. G. was induced to subscribe to a northern paper, which zealously advised the farmers to plant the Morus Multicaulis and to raise silk worms. Intent upon money making, he resolved to acquire a fortune by raising and then selling the Mulberry. He invested \$1,000 in little Mulberry slips at 4 cents each, and planted them in a lot. A few months after, his delightful visions took wing. The Morus Multicaulis mania—like the Tulip mania which once prevailed in Holland—had a brief existence. Mr. G. had demonstrated his ardent desire to advance agricultural improvement by subscribing to the agricultural paper just men-The result was unfortunate. Ever tioned. since that time, he has abhorred and denounced all agricultural papers and agricultural books, as the mere instruments of deception and the organs of villainous imposture. If you were to suggest to him the propriety of subscribing for the Southern Planter, he would probably knock you down. He threatens to disinherit any son of his, who in disregard of his orders, shall venture to look at any agricultural journal, or quote before him an agricultural book. By his stubborn refusal to profit by the agricultural information which he might easily have acquired within the last fifteen years, he has lost more than he expended upon his Morus Multicaulis speculation.

Mr. H. cherishes old customs and abhors nearly every innovation, and is "too old a bird to be caught with chaff." His neighbours may throw away their money in buying all kinds of new machines, but being a prudent and sagacious man, he waits until he can profit by their experience. Many years back, they abandoned the absurd practice of treading out their wheat crops with their horses and upon the barnyard, threshing machines were introduced and proved entirely successful. After cogitating, hesitating wheat, and by the 1st of August he and his and reflecting upon the subject from time to family start for the White Sulphur. His fre-time, for five years or more, Mr. H. concluded quent trips to the Springs in pursuit of recreathat he would purchase a wheat machine the tion and pure air have probably cost him not next year. In the interim, he had a visitor who

hailed from Vermont, and who had for sale machines for washing clothes more elegantly, economically and expeditiously, than clothes ever had been washed before. Mrs. H. begged her husband to relieve her of vexation and trouble. by buying one of these admirable machines, the utility of which was so apparent, and the price so very moderate—only \$20. While Mr. H. loved his money, he loved his wife, and as this was the first time she had ever asked him to indulge her, he bought a machine and paid the money without a sigh or a tear. The machine soon proved to be utterly worthless and ergo, argues the logical Mr. H., all wheat machines, &c. recommended for agricultural purposes are no better. He congratulated himself, that he only paid \$20 for his experience, declares that but for that little enterprise of his dear wife, he would, by this time, have sunk at least \$500 in buying wheat machines, boasts publicly, that although he has made wheat for nearly forty years, he has never bought or hired a wheat machine, and swears that he never will to the day of judgment. His neighbours confidently assert that he has lost hundreds of dollars for the want of a wheat machine, while he declares that his Vermont friend is the most consummate and magnificent swindler in the Union, though indirectly a great benefactor to him as a teacher.

Mr. I. says that he suffers considerably from the depredations of rats, which he thinks destroy annually at least twenty barrels of his corn, besides eating wheat, &c. Being a rigid economist, he peremptorily refuses to buy any rat traps, or any thing else to protect his corn or meat house. He has never lost a pig or lamb by foxes, to the best of his recollection, and huntsmen contend that foxes are rarely ever heard of in his neighbourhood. Mr. I., however, asserts, that these circumstances do not prove that his lambs and pigs are not in some danger. He had several hounds, but they having gone off and killed thirty fine Cotswold sheep belonging to a neighbouring farmer, the law of retaliation was promptly enforced upon the aggressors. Determined to protect his lambs and pigs, and having by the way, a slight penchant for fox-hunting, Mr. I. shortly after purchased six fine hounds which cost him only the small sum of two hundred and fifty dollars. He is proud of his bargain and declares he would not sell them for \$500. He spends a great deal of time in fox-hunting, but has never caught a fox. When I last saw him, he swore, that unless the rascally rats would emigrate, he would sell his premises and move to Texas before the end of the year.

But enough. The rain is over, the sun is shining, and I must go out and attend to my crops. Wishing you, Christopher, and all of my agricultural brethren, health and prosperity, I remain

Your kinsman and friend, LEWIS LIVINGSTON.

June 10, 1856.

# DISEASE AMONG FOWLS.

SPOTTSYLVANIA, July 12th, 1856.

Mr. Editor:-Will you or some of your numerous subscribers inform me of a remedy for a disease which has prevailed amongst my fowls of all kinds since 1848. During that year we lost from two to three hundred of different kinds of fowls, viz: Turkeys, ducks, (both kinds,) dunghill and guinea fowls. This year my wife has lost all the goslings she raised, and the disease bids fair to be as fatal as it was in 1848. The first symptoms are a partial loss of the use of their legs, and in some cases, particularly with ducks, there is a watery fluid running from the mouth. In a short time they are deprived of all use of their legs, and in a short time die, often the first day of the attack, rarely living beyond the third day. The disease seems to be confined to my premises, as I have not heard of any of my neighbours having lost any. If you, or any of your subscribers know anything about the disease you will please inform me through your valuable paper.

## A SUBSCRIBER.

# OXEN VS. HORSES.

The "Wool Grower" says that "the plowing matches throughout the country have established the fact, that oxen can plow a given space of ground as quick and as well as horses." We do not know how this may be, but we do know a gentleman who puts a yoke of Devon oxen to a plow, immediately behind a team of three good horses, and they do the same days work of plowing that the horses do. They are stabled and curried and fed like horses, and do all the works required of them with as much spirit.

### SMUT IN WHEAT.

Should there be smut this harvest, will the observer be kind enough to examine the smutted heads carefully, it may be he will find all the smut grains punctured through the chaff by some small insect, (several species perhaps), when in the milk state; the atmosphere being thus admitted into the grain, fermentation may be found to have taken place, and the smut produced. This would account for sound and smutted grains in the same head, and perhaps the only rational way of doing so.

Don't Forget.

### WET LANDS.

If any of your fields are wet make arrangements to have them thoroughly drained, and take our word for it, that the expense the draining may cost you, will be returned

with compound interest in a few years. can make one of these machines in two Your soil once relieved of excess of water, days. It is upon the following plan: Make their textures will become greatly improved. their earliness will be increased fully three weeks, and to that extent you may be able to work them earlier in the spring; their productive capacity will be increased at least one-third; they will produce crops of better quality, and withal the health of your place will be meliorated.

# CLOVER SEED-GATHERING AND CIEANING.

In the May number of the Valley Farmer we promised to give some information in regard to the proper machinery for gathering and hulling Clover seed, the manner of gathering, &c

When it is intended to save the seed from a crop of clover, the spring growth should be cut for hay, or it may be pastured. When eaten quite close, the stock should be turned off till the seed is ripe

and harvested.

The most common method of saving clover seed, is to mow it at a time when the largest quantity of seed is ripe, and before it begins to fall off from the heads. The heads, when fully dry, are threshed off by hand or with a thresher, or trod out on a barn floor, or in the field. The straw is then separated from the chaff and the seed is ready to be hulled and cleaned. With Manny's Combined Reaper and Mower, which is adjustable to cut any height, the heads can be cut off and received upon the apron until full, and then cast off in heaps upon the field.

There are also a number of Patent Clover Seed Gatherers. These we have never seen in operation, but understand some of them perform well. The best that we have seen is patented by Mr. John S. Gage, of Michigan. We expect to see these fully tried the present season and will then publish the result. We once made and used for many years, a very simple machine for gathering clover heads, with which a man and horse can go over and gather the seed from double the quantity of land in a day that he can cut over with a scythe; and when the heads only are gathered, they require no other labor, except drying, to pre- Missouri the following letter, which was pare them to run through the hulling and sent him by a gentleman in Ohio, upon the cleaning machine. Any tolerable workman subject of clover seed. It contains infor-

an ordinary sled with the sides or runners 14 inches wide and 6 feet 6 inches long. These may be placed 5 or 6 feet apart, and secured together with two cross pieces only at the back end, leaving the forward part open to the length of 31 or 4 feet; then a box is made to nearly fill the width between the runners. The box is 4 feet long and 15 inches deep, with the forward end open. To the cross pieces at the bottom of the box, at the forward end, teeth of hard wood are secured so as to project about 12 inches; they should be 3 of an inch thick and 1 inch wide on top and made a quarter of an inch narrower or beveling on the underside. These teeth are placed three-sixteenths of an inch apart, so as to form a comb. If the upper sides of the eeth were capped with hoop-iron, neatly fitted, it would be better. This box is hung between the sides of the sled upon two gudgeons or pins two inches in diameter, just as a cannon is hung in its car-With two handles, four feet long, riage. secured to the box and projecting behind, the box may be moved on the pins so as to raise or lower the teeth to adapt them to clover of any height. A man with a horse can strip the heads from four or five acres of clover in a day with this machine, and collect it in the box. With one of these machines a farmer can gather as much seed in a day as would be required to seed forty or fifty acres. It needs no hulling or cleaning unless it is designed for market. Some prefer to sow the seed in the chaff to that which is cleaned.

For market, the seed must be hulled and cleaned. For this purpose a great variety of machines have been invented, nearly all, however, upon the same general principle. Those in most common use in the clover growing counties of Ohio, are Mans. field's patent, manufactured by Mansfield & Whiting, Ashland, Ohio, and Crawford's patent, by other manufacturers. A specimen of these machines may be seen at the Reaper Warehouse of H. B. Howard, in Louisville, Ky. Others may be seen at the Agricultural Warehouse of Wm. M. Plant & Co., St. Louis, Mo.

We have received from a gentleman in

publish it in this connection. The Syracuse machine referred to, is the Endless Chain or Railroad Horse Power and Thresher, manufactured by Emery & Co., and Wheeler, Melick & Co., in Albany, N. Y. In order to make the subject of cleaning with the Thresher, as referred to, a little more clear, we will state that the teeth in the Thresher are placed spirally around the cylinder, the front of the cylinder being cased up with iron or wood. The seed is filled in rather compact at one end, and by the spiral action of the teeth it is hulled as it is forced forward and discharged at the other end of the cylinder. The method of hulling will answer where a farmer has the Thresher on hand, but a regular Huller which hulls and cleans the seed at one operation, is to be preferred. These are run by any of the ordinary hors powers, the same as a common wheat thresher is run.

BUCYRUS. Ohio.

Dear Sir,-Yours of the 4th inst. was received last evening. It is with pleasure that I furnish you with all the information within my reach, on the subject mentioned in your letter, to wit: the Raising of Clover and Clover Seed.

I have consulted a Mr. Ludwig, who is a farmer of much practical experience and observation. I have also consulted some other farmers whom I knew had raised considerable clover seed, and I find their statements all substantially agree. I therefore give you the information as derived from Mr. Ludwig, believing his to be as reliable as any to be obtained on the subject. I drew up a series of questions which I supposed would, when answered, embrace the information you desired, and obtained his answers thereto in the following order:

1st. What is the best soil for the culti-

vation of clover? Ans.—Clay soil, decidedly, for clover or wheat. Lime should be an ingredient of the soil.

2d. The best method of preparing the ground?

Ans.-I have found it best to prepare the ground well for wheat, and if it has H. Mansfield, of Ashland, Ohio. not been done in the last three years, the subsoil plow, or Michigan Double Plow acre in Crawford county, Ohio? should be used. Sow the wheat in the

mation of so much importance that we fall, and on the same sow clover in the spring.

The best time to sow clover? 3d.

Ans.-Generally about the first of April. if pure seed is used-if in chaff, earlier. 4th. The quantity of seed to acre?

Ans.-About eight quarts of pure seed to the acre. You can scarcely use too much.

5th. The best time to cut clover for seed?

Ans. When the largest quantity of seed is ripe. When more is falling off from over ripeness than is getting ripe, it is high time to cut.

6th. In what manner should the grass

be treated when cut for seed?

Ans.-Get it dry as fast as possible, and with the least handling. Get it into barn (not stack, it will not turn rain). It was formerly the plan to let it lay to bleech. That is wrong; it should not get wet if it can be avoided. It causes a great loss of

7th. What is the best method of getting out the seed?

Ans.-I have used and seen used a number of Clover Hullers, but have found a good Syracuse threshing machine (for wheat) to answer the best, by adding thereto a concave of sheet iron, to be placed on the outside of the cylinder; the clover heads let in at one end and passing out at the other. Mr. Ludwig constructed this improvement for his own use, and also a revolving screen, through which it was first run and under which was a fan,-these separated the stems, leaves and light or seedless heads from the valuable portion, which being by this process much reduced in quantity and bulk, was then run through the threshing machine or huller, arranged as before mentioned. He however says, that it would be difficult to so describe the arrangement as to enable any one at a distance to arrange it. He informs me that by his plan he could, with three hands and two horses, clean forty bushels of seed per day. Twelve to fifteen bushels is a good business with a clover huller.

What clover machine or huller is esteemed the best?

Ans.—Those invented and made by M.

9th. What quantity is usually raised per

Ans.—It is a very uncertain crop. From

two and a half bushels per acre.

The price per bushel.

Ans .- Very fluctuating, owing to crops, here and in other clover raising districts.

Varying from \$3 to \$6 50.

best information I could obtain, and as it comes from those whom I know to be successful cultivators and those who have raised from one to four hundred bushels of seed in one year, I presume it is to be relied on as correct. This county, a few years since, sold for export, over 20,000 bushels of clover seed, which I believe is more than what has been produced by any other county in the Union.

The time is fast approaching when farming, to be successful and profitable, must be done on scientific principles. Our old guess work and chance operations will not compete with scientific knowledge

With the hope that the above imperfect information may be of some service. I am

Very resp'y yours, J. B. LARWILL.

Valley Farmer.

# HARVESTING WHEAT.

MESSRS. EDITORS:—Having observed for several years a great difference in the mode of harvesting wheat in upper and lower Virginia, I am induced to give you the cutting of my hands, who harvest as they do in the Valley, the great wheat growing section of the State. I commenced on the 16th of June.

Acres. Roods June 16, Monday, worked 83 hours and cut 12 June 17, Tuesday, worked 91 hours and cut 13 3 June 18 and 19, helped a friend in his harvest. June 20, Friday, worked, 1034 hours, and cut 16 June 21, Saturday, worked 11 hours and cut 11 June 23, Monday, worked 7½ hours and cut 10 June 24, Teusday, worked 10 16 0 hours and cut, Worked 6 days, only cut du-

ring 57½ hours, and cut a-78

days of 10 working hours, give 5 days and and then whet, as it did to cut the swath.

seven bushels to a total failure. Average, (about \( \frac{3}{4} \), which would bring the average to about 13 acres to 3 scythemen, or  $4\frac{1}{2}$  acres to each scytheman per day. This work was done without a word of hurry during the harvest. On Saturday three cutters worked in the forenoon and only two in I have given you what I believe to be the the afternoon, yet I have made no deduction in the table of time and quantity.

> My mode is this; I use a light cradle with only 4 fingers, which, with the blade, weighs 61 lbs. We cut the grain and lay it, or cradle it; a lad (a half hand) follows with a long handle rake, and rakes the cut wheat into bundles; a woman, or three quarter hand, follows next, who also carries a long handle rake; this hand binds the wheat with a double band, throws the bundle behind, rakes the butt of the bundle, rakes up trash wheat and places upon the next bundle, and binds the whole together. This operation, if well done, gets nearly every straw and head.

> I worked only 4 takers up after 3 scythemen. I should have had 6; if so, I could have cut a great deal more grain in the same time. I cut only what the hands could take up. My force consists of 4 men under 22 years old, 1 lad about 14 years, and 2 boys 9 years each. I hired the first two days a Prince George cutter, but he soon gave out, and was too trifling to work. I also hired during these two days and after, 1 young man, a very poor binder, a boy who could neither rake nor bind well, and an old man, who was a good, but a very slow hand at shocking. My harvest expenses were \$17, and my hands earned for themselves in the two days they cut from home \$10. This, of course was mine, and had I retained it, my harvest expenses would have amounted to \$7.

Some of my neighbors say my mode of cutting (never walking back with the scythe on the shoulder, if the wheat does not compel you to do so by leaning very much,) would prevent their getting hire-What an idea! Judge H. St. lings. George Tucker, used to say that rye and sheep were more abused than any two things he knew of—that you would be told any time to sow rye, and any place for sheep. Let me add the farmer to these: must he alone of professions or trades, pay a man for working half of the working day? It will take a man nearly as long to Fifty-seven and a half hours reduced to walk back with the cradle on the shoulder,

dependent on the free negroes than the negroes are on them? If so, I have got-

ten into the "wrong pew."

My hands cut twenty strokes in one minute, when going at their ease, and in making twenty strokes they pass over 22 yards. They, in such wheat as I had, averaged 9 feet or 3 yards, to the swath. In sixty minutes, or one hour, they would cut 1320 yards, which multiplied by the breadth 3 yards, and the product divided by 4840, gives about 3 roods and 10 perches. Ten hours would therefore cut 8 acres. 0 roods, 20 perches. My hands only averaged 4th acres, and I therefore lost by the trees that were bent almost to the whetting, drinking and stopping, 31 acres Is not this enough to lose? I am informed that 2½ acres per day to the scytheman is thought a fair day's work. I pity the farmer, for he is certainly very thoroughly and systematically abused. I have known 7 acres to the scythemen to be averaged throughout the harvest in heavy wheat. This was done by putting 3 good hands on each swath. They cut fast and saved all, which is economy in the end

Cutting and catching, or gripping the wheat, is a piece of old fogyism that should at once be abandoned in lower Virginia.

Very Respectfully,

THOS. G. BAYLOR.

Arrow Wood, Pr. Geo., June 25th, 1856. Southern Farmer.

# WHAT MAY BE DONE WITH A POOR ORCHARD.

We condense from the experience of a friend, whose whole statement would occupy more space than we can give. The following may be relied on as entirely accurate:-Five years ago, he purchased an orchard containing 23 years. They had never borne much, having been planted but a few years. Their treatment had been miserable. Cows and horses had been pastured in the orchard. More than one quarter of the trees had been bruised or bent, so that it seemed that they must die. The rest had been left unpruned, the suckers were growing from their roots, and large scars where the bark had been torn off by the horns of cattle, disfigured many of them. The insects, too, had held carnival among them. Apple borers had pierced their trunks; caterpillars had spun their webs from year to year in their branches; and ants, whose hills had multiplied

Are the farmers of Prince George more (around, were swarming on the trees or fruit, during all the warm months.

> Such was the condition of the trees. When our friend considered the case, he seriously thought of cutting them all down, and beginning anew. But the entreaties of his wife, who thought that some fruit might be grown on some of the trees. while a younger orchard would be coming on, induced him to try what could be done with these ragged, hopeless subjects.

His plan was a simple one. He turned out all animals. He pruned the tress carefully, covering all the wounds with grafting wax or shellac. He propped up ground, and covered the large scars with cotton cloth that had been spread with grafting wax. He removed all the sbrouts from the roots, and kept them cut off as fast as they re-appeared. He battled the insects as best he could. The borers he dug out of the trees, with a knife. The cater-pillars he burned up, cutting off the limbs where their nests were, and putting then into the kitchen stove. The ants he destroyed by pouring hot water after the Monday's washing, into their hills. And he destroyed the moss, and numberless eggs, and grubs, by removing the rough bark, on the trunks and limbs, and washing the trees generously with old soap. He enriched the ground by spading under madure mixed with lime, and a little salt. This course he has kept up, as he thought needful, every year since.

But what are the resuits? We will state them. Fvery tree has lived. The most hopeless ones have borne generously. The trees have quadrupled the size of their tops in the last five years. Thd orchard attracts the attention of every passer by. All exclaim: "What fine apples you have Mr. -!" The insects, above mentioned, have almost entirely disappeared. Last year, (1855,) these 23 trees bore between 100 and 150 bushels of apples, and when this statement was made to us, more than half of them was just blooming, as if for another generous yield in 1856. Such are the resuls thus far.

Our readers will not wonder that our friend is greatly encouraged by his experiment. He adds at the end, this application:-1. Consult your wife before cutting down your apple trees. 3. Take good care of your trees if you have any. 3, Don't be

less prospects. 4. Take the Ohio Farmer, for it was from this, (he says), and from other less valuable papers, that he gained the knowledge to which enabled him to save his orchard. - Ohio Farmer.

# BROADCAST CORN.

As your pastures will be giving out in August and September, it would be well to put a few acres in Indian corn sown broadcast, in order that you may have provender to soil your stock upon. An acre will grow food enough for 10 head of stock. In the preparation of the ground, manure liberally, plough deep, and harrow and roll till you get a perfectly fine tilth; then sow on each acre 3 bushels of corn, harrow and cross-harrow that in, and then roll.

# THE APPLICATION OF LIME.

A WELL-KNOWN Virginia farmer, who is generally "down" on everything having any affinity to agricultural chemistry, writes us as follows:

that of most agricultural editors, and am ty in question in a greater or less degree. about to prove my sincerity by asking Pure sand, it was found, did not possess you, without alluding to me, however, to write an editorial, giving the views of soil, it was proved, had nothing to do with Prof. WAY on the application of lime-I it. have no access to them myself—and their soil did not increase its absorptive power, adaptability to stiff clay flats, wet, but rich and indeed it was found that a soil in when drained and limed-diluvium.

"The question of applying lime to such soils is one of much interest to me, as I moving ammonia or potash from solution. have several hundred acres of just such land in cultivation to which I should be arrest ammonia, potash, magnesia, phos-

yourself among slave owners."

The views of Prof. WAY, (Chemist to due to the clay which they contain. In the Royal Agricultural Society of Eng- the language of Prof. WAY, however, land,) referred to, we presume are those some three years ago, portions of which part in these changes, or whether there were pretty extensively copied into our existed in clay some chemical compound

agricultural papers at that time.

gations on the "absorbtive properties" of the extent to which clay was able to unite soils. He found that ordinary soils pos- with ammonia, or other alkaline bases; sessed the power of separating from solu- and it soon became evident that the idea tion in water the different earthy and al- of the clay as a whole being the cause of kaline substances presented to them in the absorbtive property, was inconsistent manure; thus, when solutions of salts of with all the ascertained laws of chemical ammonia, of potash, magnesia, &c., were combination." made to filter slowly through a bed of dry soil, five or six inches deep, arranged in a WAY came to the conclusion that there is

encouraged in view of some rather hope- [from solution, but the filtered liquid would contain sulphuric acid in abundance-not in the free or combined form, but united to lime; instead of sulphate of ammonia we should find sulphate of lime in the solution: and this result was obtained, whatever the acid of the salt experimented upon might be. It was found, moreover, that the process of filtration was by no means necessary; by the mere mixing of an alkaline solution with a proper quantity of soil, as by shaking them together in a bottle, and allowing the soil to subside, the same result was obtained. The action, therefore, was in no way referrable to any physical law brought into operation by the process of filtration.

> It was also found that the combination between the soil and the alkaline substance was rapid, if not instantaneous, partaking therefore of the nature of the ordinary union between an acid and an alkali.

In the course of the experiments, several different soils were operated upon, and it was found that all soils capable of pro-"I respect your science more than I do profitable cultivation possessed the properthis property. The organic matter of the The addition of carbonate of lime to a which carbonate of lime did not exist possessed in a high degree the power of re-

To what, then, is the power of soils to happy to introduce you if you can trust phoric acid, &c., owing? The above experiments lead to the conclusion that it is

"It still remained to be considered, contained in a lecture of his delivered whether the whole clay took any active in small quantity to which the action was Prof. Way had made a series of investi- due. This question was to be decided by

flower-pot, or other suitable vessel, it was tv. observed that the liquid which ran through. no longer contained any of the ammonia success as lime, and yet "who among us," or other salt employed. The soil had in says Prof. Way, "can say that he perfect substance while the water in which it pre-

viously dissolved passed through.

Further, this power of the soil was found not to extend to the whole salt of ammonia or potash, but only to the alkali itself. If, for instance, sulphate of ammonia were the compound used in the expefound naturally in soils or produced artifi- ashes of plants, that therefore its applicawith it, the ammonia or potash taking the tance of a plant. place of the lime or soda.

that soils have "absorptive properties" that has been long known-but that they absorb ammonia, potash, phosphoric acid, &c., by virtue of the double silicate of alumina and soda, or lime, &c., which they

contain.

Soils are also found to have the power

of ammonia, from the air.

WAY, "that soils acquire fertility by exposure to the influence of the atmosphere—Hence one of the uses of fallows. \* I find that clay is so greedy of amof ammonia, so as to be highly pungent, is passed through a tube filled with small operates. fragments of dry clay, every particle of the gas is arrested."

This power of the soil to absorb ammonia is also due to the double silicates. But there is this remarkable difference, that either the lime, soda, or potash, silicate is capable of removing the ammonia from solution, the lime silicate alone has the power of absorbing it from the air.

It is on this fact, that the views of Prof. WAY, to which our correspondent refers,

There is no manure that has been so extensively used and with such general says Prof. Way, "can say that he perfectsome form or other, retained the alkaline ly understands the mode in which lime acts?" We are told that lime sweetens the soil, by neutralizing any acid character that it may possess; that it assists the decomposition of inert organic matters, and therefore increases the supply of vegetable food to plants; that it decomposes the remains of ancient rocks containing potash, riments, the ammonia would be removed soda, magnesia, &c., occurring in most in clays, a peculiar class of double silicate soils, and that at the same time it liberates to which the absorptive properties of soils silica from these rocks; and lastly that He found that the double sili-lime is one of the substances found unicate of alumina and lime, or soda, whether formly and in considerable quantity in the cially, would be decomposed when a salt tion may be beneficial simply as furnishof ammonia, or potash, &c., was mixed ing a material indispensable to the sub-

These explanations are no doubt good Prof. WAY's "discovery," then, is not as far as they go, but experience furnishes many facts which cannot be explained by any one or all of these suppositions. Lime, we all know, does much good on soils abounding in organic matter, and so it frequently does on soils almost destitute of it. It may liberate potash, soda, silica, &c., from clay soils, but the of absorbing ammonia, or rather carbonate application of potash, soda and silica has little beneficial effect on the soil, and "It has long been known," says Prof. therefore we cannot account for the action of lime on the supposition that it renders the potash, soda, &c., of the soil available to plants. Furthermore, lime effects great good on soils abounding in salts of lime, monia, that if air, charged with carbonate and therefore it cannot be as a source of lime for the structure of the plant that it

None of the existing theories, therefore, satisfactorily account for the action of lime. Prof. Way's views are more consistent with the facts of practical experience; but they are confessedly hypothetical; and his more recent investigations do not confirm the idea that lime acts beneficially by converting the soda silicate into the lime silicate.

Thus, six soils were treated with lime water till they had absorbed from one and are based. Lime may act beneficially on a half to two per cent of their weight of many or most soils, by converting the lime. This, supposing the soil to be six soda silicate into a lime silicate, or in inches deep, would be at the rate of about other words, converting a salt that will not absorb carbonate of ammonia from the air, amount of ammonia in the soil was deinto a salt that has this important proper- termined in the soil before liming, after

liming, and then after being exposed to special cause, and probably it arises from absorbed as much as it would. The following table exhibits the results:

This negative truth of Prof. Way's hypothesis, for it may deed, the extent to which the natural soils must promote." absorbed ammonia-equal, in No. 3, to to have been the case.

The lime liberated one-half the ammonia be brought into use." contained in the soil.

justified in believing it to be due to some its application would be in some sort an

the fumes of carbonate ammonia till it had the existence of some compound silicates containing ammonia, of which lime under the circumstances can replace one-halfforming, for instance, a double silicate of alumina, with half lime and half ammonia-such compounds are not unusual or new to the chemist."

This loss of ammonia from a heavy dressing of lime is very great. A soil five inches deep weighs in round numbers 500 tons, or 1,000,000 lbs. The soil, No. 1, contained 0393 per cent. of ammonia, or in an acre, five inches deep, 293 lbs. After liming it contained 0169 per cent... or in an acre five inches deep, 169 lbs. The loss by liming is 124 lbs. of ammonia per acre. This is equal to the quantity contained in 800 lbs. of good Peruvian guano, or 12½ tons of barn-vard manure.

In commenting on this great loss of ammonia from liming, Prof. Way observes:

"Is it not possible, that for the profitable agricultural use, the ammonia is too highly locked up in it? Can we suppose that the very powers of the soil to unite with and preseve the elements of manure are, however excellent a provision of nature, yet in some degree opposed to the growth of the abnormal crops which it is the business of the farmer to cultivate? There is no absolute reason why such should not be the case. A provision of nature must relate to natural circumstances; for instance, compounds of ammonia may be found in the soil capable of giving out to the agencies of water and air quite It is evident that lime neither assisted enough of ammonia for the growth of ordinary plants and the preservation of their monia, and hence the beneficial effect of species; but this supply may be totally in-

Now it is not impossible that the laws result, however, does not disprove the which preserve the supply of vegetable nutrition in the soil, are too stringent for be that the silicate salt in the natural soils the requirements of an unusual and exceswas that of lime and not that of soda. In- sive vegetation, such as the cultivator

"In the case of ammonia locked up in about 7,000 lbs. of ammonia per acre, the soil, lime may be the remedy at the equivalent to the quantity contained in command of the farmer—his means of ren-700 tons of barn-yard manure-shows this dering immediately available stores of wealth, which can otherwise only slowly

"In this view, lime would well deserve "This result," says Prof. Way, "is so the somewhat vague name that has been nearly the same in all cases, that we are given it, namely, that of a 'stimulant;' for sive application, by driving off ammonia, would lead to all the disastrous effects which are so justly attributed to it."

"I do not wish to push this assumption too far," says Prof. WAY, in conclusion, "but if there be any truth in it, it points out the importance of employing lime in

small quantities at short intervals, rather than large doses once in many years, [as is the general practice in England."

Genesee Farmer.

[For the Southern Planter.] RAISING HORSES—LETTER FROM THE LATE WM. R. JOHNSON OF CHESTERFIELD.

GLOUCESTER Co., July 5th, 1856. Gentlemen:

As the author of the accompanying letter addressed to me, in answer to mine, written about the same time, will no doubt be considered high authority for the opinion expressed on the subject of raising horses, I take leave to forward a copy for pulication, in order that the information it contains may be generally disseminated by means of your valuable and useful paper.

I omit that portion of Mr. Johnson's letter on business of a private nature. Should you deem the letter of sufficient importance to occupy a space in the Southern Planter, you are at liberty to

publish it as a contribution from a SUBSCRIBER.

Petersburg, 14th Aug. 1830.

My Dear Sir:

My absence from this place has prevented me from receiving your esteemed letter of the 24th ult. until now.

letter, I will with the greatest pleasure

answer them.

I do not believe that mares in foal should be housed too much when they result was entirely satisfactory. are advanced in age, they should be put up weather was as fine and balmy as leafy June in bad weather; if the pasture is good they ever brings, which not only favored, the require no feeding—if it is such a one only attendance of purchasers, but induced as reduces them, they ought to be fed many residents of the great Metropolis to with corn or oats—corn is best in the win- take the opportunity of visiting one of the ter and oats in the summer-mares ought pleasantest places in the suburbs, and to be kept in snug saddle horse order, many gentleman and ladies went out in never made too fat or overloaded with carriages. For several hours on the first flesh—gentle exercise either in harness or day of the sale, the avenue leading to the

application of ammonia, while its exces-totherwise is not injurious but rather beneficial, unless the mares are very old, then they ought to do nothing but breed-but until they are 12 or 14 years of age they can be moderately used and safely too till within a month of the time of foaling.

After the mares have coalts they ought to be fed with oats for two weeks and then be governed by circumstances. If the mare and coalt do well upon pasture it is unnecessary to feed, and the condition of the mare and coalt will show.

Clover when young is good grazing, but only when young ordinary pasture. Short grass is far preferable, and if not sufficient,

feed them night and morning.

Colts should be weaned at about six months old, generally as soon you have gathered fodder; if you have two coalts turn them in the corn field-if but one put it in a stable and feed it with meal and oats three times a day, only giving it a little at a time, not more than it will eat. feed ought to lay by a coalt: after your coalts are weaned turn them out in all good weather, and so trot them as to keep them growing, but never too fat; if promising and large don't force its growthif small push it and so continue until two years old, then break it gently and by degrees afterwards it ought to be trained, and by the coalt its management must be governed.

If this sketch is not sufficient for you or any of your friends, I will with the greatest pleasure answer any inquiry you may

make of me.

I am in heart, most respectfully. W. R. JOHNSON.

### GREAT SALE OF LIVE STOCK.

Col. Lewis G. Morris's sale of live stock With regard to the questions in your took place at his residence, Mount Fordham, N. Y., on the 24th and 25th of last month. All circumstances relating to the occasion were highly favorable, and the

semblage comprising some of the finest "turn outs" of the city and neighborhood. A company amounting to 1200 or 1500 persons was collected. Yet so ample and complete were the arrangements, that everybody was perfectly accommodated-everybody was pleased and determined to please

everybody else.

After a few hours given to the inspection of the stock, which had been conveniently placed for that purpose, the company were invited to refreshments. The ladies numbering upwards of 300-and the gentlemen whose principal duty for the day was to attend them, were entertained at the mansion, under the charge of Miss Morris, Col. M.'s niece. The larger and more strictly business portion of the company, lunched at the barn, where extensive tables were set with everything essential to the comfort of the inner man.

A little before three o'clock, the auctioneer, Col. James M. Miller, announced that he was about to commence the sale. The stand was the same which was occupied at Col. M.'s previous sales-in an open field, beneath the shade of "tall ancestral trees." The animals to be sold on the first day were secured in temporary stalls. the cattle,—including the finest of the rethem collected under the trees on the the same for \$350. lawn, and for their gratification the shepconvenient for observation—a very inter- number. which the numerous spectators appeared Samuel Thorne, of Washington Hollow, delighted.

The stock sold consisted of Short-horn and Berkshire swine. For future reference, obliged to defer till next week. we shall publish an authentic list of the sale. Some general remarks, however, well, with the exception of old boars,

generally satisfactory. But the most grati-fying feature in connection with it, so far \$27 50. Essex sows brought from \$50

mansion was literally thronged-the as-(as the public is concerned, was the discrimination generally shown in reference to the stock. We have never before attended a sale where the relative merits of the animals was so correctly appreciated an important fact, as showing the progress which has been made in the knowledge of points by which stock should be judged. The bidding for all the good animals—except in a few instances where age was against them-was very spirited, and they were quickly knocked off at good prices.

The Short-horn bulls were first sold. Romeo, six years old and very heavy, was bought by Reber and Kuts of Lancaster, Ohio, for \$600. They were prepared to give double this sum. Orpheus, seven months old, by Duke of Gloucester, out of Songstress, was bought by J. B. Crippen, of Coldwater, Mich., for \$675. Marmion. eight months old, was bought by B. and C. S. Haynes, of Elizabethtown, N. J., for

The Devons sold well. Frank Quarterly, five years old, was bid off by Col. B. P. Johnson, of Albany (for what destination we are not advised) at \$350. Master Birthday, four months old, was bought by Richard Peters, of Atlanta, Ga., for \$340; a higher price than we have ever before over which canvass was spread. Some of known obtained for a Devon of this age in this country. Birthday, an imported cow served Short-horns, and the entire flock of twelve years old, sold to L. H. Colby, of South Down ewes—were in the meantime Groton Village, Tompkins County, N. Y., disposed on the broad lawn in front of the mansion, and thus formed a most attractive Francis Morris, of Throgg's Neck, N. Y., rural scene. After the ladies had parta- for \$440. Princess, nine years old, sold ken of refreshments, a large number of to the same for \$340. Birthday, 4th, to

In no country does it flourish better than in the United States no where else do we find the luxury of hot buckwheat cakes so frequently upon the breakfast table.

Buckwheat will grow on the poorest of sandy soils, and it has been extensively cultivated for the purpose of plowing in as a manure. Nevertheless, we are inclined to consider buckwheat as an exhausting crop. EMERSON, in the Farmers' Encyclopedia says: "It is generally thought to be a severe crop upon land, and for this reason it is seldom sown upon highly improved ground. Rough and hilly districts are considered peculiarly favorable to the culture of buckwheat, which is admirably per acre doubling the crop. adapted to subdue new or wild lands."

of his experiment with it upon a clay loam a small patch of buckwheat should always recently limed; from the results of which be sown. he warned his brother farmers that it is "needless to attempt to grow it upon damp try. Pigs thrive upon and are fond of it, soils, or to expect full crops upon lands and when bruised it is good food for horexhausted by over cropping." They are gross feeders. - Genesee Farmer.

# THE CULTIVATION OF ROOT CROPS.

Ат a recent Legislative Agricultural Meeting in Boston, the subject of "Root Crops" was discussed, and we condense from the New England Farmer such portions of the discussion as we think may be interesting and useful to our readers at this season:

SIMON BROWN, Esq., of the New Engridge thus formed, the seed is sown; the and grains. ridge being first flattened a little. The lafond of them, and they are highly nutri- but throughout the State. tious. He had not succeeded so well with Mr. Brown stated the result of feeding

profit.

Round turnips may be cultivated easily designed for grass, the ground being first plowed in July, and thoroughly prepared for grass, and the turnip seed being sown along with the grass seed. From three hundred to seven hundred bushels per acre may be obtained without any extra labor except that of gathering them. This method impoverishes the soil very little.

The advantages of feeding roots to stock were next referred to. He had been told that milk could not be made for market unless the cows were fed on meal of some kind; but he had found it too expensive to feed wholly with meal and hay. Havland Farmer, said he thought we did not ing determined to try roots, after an expevet fully understand the value of root riment of feeding six cows with meal one crops. In England they are highly val-season, he fed the same six cows with the ued, because more can be obtained from same kind of hay, and with roots, the next the same surface for the support of cattle, season. The roots were of various kinds, by their cultivation, than by the cultivation of grain, and because they are valuation, parsnip, and carrot, and these were ble in producing beef and mutton, which mixed in feeding. After being milked in are in great demand there. They are a fa-vorite diet for sheep. With us, there is a bushel of mixed roots, which they ate prejudice against the cultivation of roots, greedily. There was no complaint of the perhaps on account of the amount of labor turnip taste in the milk, and his milk man They need a deep soil, and returned him cash for twice as many cans most farmers have not got into the habit of of milk as he did the year before, when cultivating deeply. Not more than one they were fed on grain. In closing, Mr. Brown expressed tivating, it is necessary to have the ground the opinion that more could be made from well pulverized, and then two furrows are a given number of acres by the cultivation turned together, and upon the top of the of roots, than by the cultivation of grasses

Mr. WILLIAMS, of Hadley, was of opinbor of harvesting them is less than that of ion, that root crop might be raised with turnips or ruta bagas. Cattle are very great advantage, not only in his vicinity,

beets as with other roots; but he had no round turnips to a cow for fattening, to

made her very fat indeed, so that she was sought by the butchers at a high price. In preparing the land for turnips, he pulverized it well, and levelled with brush harrow. The seed was sown in drills, marked out with a machine prepared by himself. The labor of sowing in that way was very little, and they were weeded principally with a wheel hoe. He had recently seen a plan of a cultivator which weeded both sides of a row at once, but he had not seen it tried.

Mr. J. L. LOVERING, of Vermont, said that though root crops were perhaps less cultivated in Vermont than Massachusetts, there are few farmers who do not raise more or less. They raise many sheep. and it is becoming an axiom that no farmer can have a good flock of merino sheep who does not feed them with roots as often as twice a week. The green food seems to prevent some of the diseases to which they are subject when not thus fed. Ruta bagas are raised principally for feeding stock. He had not succeeded wellwith getting his carrots to germinate, as for some cause or other the seed failed; but when they came up well, he had no difficulty in obtaining a large crop. had raised at the rate of twelve hundred bushels to the acre, add he thought them better than ruta bagas. Potatoes are still fed to stock a good deal in Vermont. Many are raised, and if they will not bring in market about twenty-five cents a bushel. they are considered worth that to feed out. Some farmers cook ruta bagas before feeding, and one gentleman had recently fattened a pair of old cattle with ruta bagas worth twice as much when cooked as when fed raw. Turnips are fed to sheep, and are thought to he better for them than carrots, or other roots, producing a better quality of milk for the lambs.

Gen. Towne, of Worcester county, had a very high opinion of the importance of roots for feeding stock; the sugar beet, for beef and for stock generally, was in his opinion, decidedly the best root that be held responsible. grows. One great advantage in raising teem is, that the tops are very good indeed He always meant to for young hogs. have some pigs about the first of September, so that about the first of October the milk of the mother would hardly be suffi- have been registered. cient for them. Then he had a yard of

which he fed thirty bushels, with hav, and (sugar beets near, and he would make a little hole in the fence so that the pigs might understand they were getting into mischief by getting among the beets, and they will eat off all the leaves, which are as good as green corn for them, and the eating of them off does not injure the crop at all. He thought the leaves more than paid for the labor of raising those which were near the hog pen.

### TO SUBSCRIBERS.

We earnestly request that you will read our "Terms" at least once a year, and always before writing us upon any subject connected with your paper. We frequently receive letters containing remittances, and others requesting discontinuances or directing a change to other post-offices when the office to which the paper is sent is not named. Such omissions occasion us a great deal of trouble, and it not unfrequently happens that your wishes cannot be attended to in consequence of your neglect to conform to this standing request.

REMEMBER always to name your post office when writing about your paper.

### THE SOUTHERN PLANTER BOUND.

In reply to numerous enquiries on the subject, we state that we can furnish the "South. ern Planter" bound, at \$1 50 per volume, postage included.

# A TAX ON FEMALE DOGS.

Holding sheep as a necessary of life to the Farmer, and viewing dogs as the greatest enemies the sheep has to contend against-worse than foxes or wolves-it is not surprising that we should anxiously desire the death of at least nine out of every ten dogs in Virginia. We view nearly the whole canine race as a pest, only endurable because we have grown up under it; and we subscribe fully to the opinion of a deceased friend of ours, one of the worth-

remitting their Subscription, should name the Office to lest of men and best of farmers, "that if there was not a dog in Virginia, and on some fine morning we should wake up and find them established among us in their present numbers. that the whole community would incontinently go mad."

> It is said, with what truth we cannot pronounce, that a law for taxing dogs can never pass in the Virginia Legislature: that two many voters who own nothing but a dog would resent such a tax as an infringement of their immemorial rights; and that rival candidates would use so potent a besom to sweep the offending Solon from his place. We shall not bring so degrading a charge against those whom the theory of our government supposes elected primarily, for their "virtue and intelligence," and therefore superior to the sordid notions which the charge implies. Nor shall we presume that any election in Virginia can be influenced by a question about dogs. But to satisfy those who believe, as many do, that such is the impediment to a necessary law, we shall offer a plan which will, if adopted, accomplish the purpose of those who side with us on the dog question, and cannot involve, very seriously, the popularity of the "ayes" who shall pass the law.

It is simply a proposition to tax every bitch in the State. The number of them is not large and yet they are the source of the evil. putting them under the ban we can stop the breed, the whole object will have been obtained in reasonable time without doing violence to the feelings of that large and respectable class called "many voters."

We are perfectly serious, though the proposition may not appear so. We believe that if petitions, properly signed, were sent to the Assembly, that we might stand a good chance to lay the axe to the root of an evil much more serious than it is thought to be, by those who have never suffered under it, or have never thought of it.

As some one must lead in the matter, at least so far as to show how it ought to be undertaken, we offer the following form of petition, which, with such alteration as he may choose, any one may copy and circulate for signature.

To the Honourable, the General Assembly of Virginia.

The undersigned, farmers of the county of -, respectfully represent, that the number of dogs now in Virginia, is a serious disad-thorses in this country, will not only extend to vantage to the Agricultural interest of the State; that the number of sheep might be vastly increased but for the losses, either actual or anticipated, occasioned by the incursions of dogs into every flock; that the present laws upon the subject are insufficient to protect either the sheep or the owners of them, owing to the difficulty of proving the act, or the invidiousness of applying try, and will further increase to the detriment the remedy.

The undersigned are aware, at the same time, that it is difficult to adopt an instant remedy in the existing state of prejudice on the subject. They would therefore most respectfully petition your honourable body to adopt such legislation in this regard as will interfere as little as possible with supposed existing immunities, and will not operate a burden or grievance on the present rights of dogs and owners; and they would suggest that a tax of not less than five dollars be laid on every bitch within this Commonwealth, charging every animal of that description in the possession of a negro to his or her owner or owners.

### IMPROVED BREEDS OF ANIMALS.

"Why shall I buy a good Bull," we have heard several times said in reply to our exhortations to various individuals to purchase improved animals; "why should I buy a good bull, or boar, or ram? My neighbours still keep the common stock of each, they permit them to go at large, as the law allows them to do, they jump, or tear down, my fences, get into my inclosures; and a runt, a "land pike," or a "shabby sheep," is the consequence."

This is most true, and it is a reflection on the farmers, that they have never made an effort to correct an evil of more magnitude than they suppose it to be.

The remedy is simple if it is only applied, and can be had, one would hope, for the asking It is merely to affix a penalty to "wilfully," or "negligently" permiting such animals to go at large. There is nothing new in this. It is now the law with respect to stallions, and has been for a great length of time, not as may be thought on account of their superior power to do mischief, but for the purpose of improving the breed. In Henning's Statutes at Large, vol. 3, p. 35, we find the following:

AN ACT FOR THE BETTER IMPROVING THE BREED OF HORSES.

Forasmuch as the breed of large and strong ing to appropriate an animal so found going at

the great help and defence of the same, but also prove of great use and advantage to the inhabitants thereof, which is now much decayed and impaired by reason that small-stoned horses of low statute and value, be not only suffered to pasture and feed in our woods and other waste grounds, but also to cover and leap mares feeding there: whereof cometh a numerous breed to the little profit, but great damage of this counthereof, unless some effectual remedy be speedily provided te prevent the same. For prevention therefore of so great an evil, and for the increase and breed of better and stronger horses hereafter to be had in this colony.

Be it enacted by the Governor, Council and Burgesses of the General Assembly, and by the authoritie thereof, it is hereby enacted, That no person or persons whatsoever, after the last day of July, which shall be in the year of our Lord 1687, shall have or put to feed into or upon any woodland grounds, marshes or other waste grounds, not haveing a sufficient fense about the same, any stoned horse or horses, being of the age of two yeares, and not being of the height of thirteen hand full and an halfe, to be measured from the lowest part of the hoofe of the forefoot, unto the highest part of the withers, and every hand full to contain four inches of the standard, upon the penalty and forfeiture of such horse or horses, or four hundred pounds of tobacco," &c.

Under this law, dating back one hundred and sixty-nine years, and steadily continued to the present day, the breed of horses steadily improved until about the time of the Revolution, when they were about at their best.

There is no reason why it should not have the same effect on other kinds of stock, at least in Eastern Virgiina, and no doubt that many are deterred from making efforts to improve for want of such a law. How many for instance, are willing to purchase such splendid cows as our friend, Mr. Mathews, of Wythe, exhibited at the Fair, when the chances are in favour of a progeny by a "ticky Bull?"

There is one defect in the law as applied to stallions which should be corrected in enactments with regard to other stock. It makes the offence punishable by a fine of twenty dollars; see Code of Virginia, p. 455; one half to the informer, and holds the offender harmless for the first offence. This is wrong; how many gentlemen would be willing to go before a magistrate at a warrant trying and present a neighbour for a nuisance of this sort, and pocket a part of the forfeiture? And how many would be found willter a second conviction. It is absurd to think

Let the offence be made a misdemeanor, presentable by a grand jury, and let the penalty be graded to the proportion of the damage done, and if, as in the case of overseer of roads, and other minor offences, let it go to the literary fund. Then there will be less difficulty in having the law enforced.

As in the case above we append the form of petition.

To the Honourable, the General Assembly of Virginia.

The undersigned, farmers of the county of -, respectfully represent that the practice of permitting Bulls, Boars and Rams to go at large is very injurious to the agriculture of the State, in discouraging the improvement of cattle, hogs and sheep in this State; that many persons would purchase superior animals of each of the above kinds, but for the knowledge that they would be contaminated by the worthless brutes that are now turned loose to roam over the country. The undersigned, therefore, most respectfully petition your honourable body to pass a law which shall make it a misdemeanor to permit any one of the above described animals to go at large out of the enclosed grounds of the owner," and that on conviction thereof, before a court of record, the offending party shall pay a certain penalty for each offence, set: in the case of a bull, fifteen dollars for the first, and every subsequent offence: In the case of a boar, five dollars for the first and each subsequent offence: In the case of a ram, seven dollars and fifty cents for the first and each subsequent offence.

If such a law is adopted, the community will then have a means of protecting itself.

If this petition, and the one we have suggested about taxing bitches, can be actively circulated, we are sure they will obtain the signatures of a great many, and may be the means of obtaining something at the hands of the Legislature, which has heretofore seemed to look with a cold and indifferent, if not jealous eye, upon various petitions which have been proffered to it

large, as any one may do now under this law af- of the Legislature next winter, we invoke our friends, if they mean to do anything in either or both of the above measures, to do it at once. We engage to see all petitions presented that are sent to us.

# CROSSKILL'S CLOD-CRUSHER.

We have had this important English implement in use for nearly two years, and can testify experimentally to its great utility, and, economically considered, to its necessity to many farmers in Virginia. But we fear its cost will be a bar to its general introduction. This ought not to be the case. The practice, too common with most of our farmers, of judging of the appropriateness of particular implements rather by their prime cost than by their capacity for executing given processes, is the falsest economy. If the principle were universal, agriculture would have made scarcely a stride in the last hundred years—the period of its greatest improvements. For instance, a good hand with a flail can thresh out, on an average, about seven bushels of wheat per day, and the flail costs nothing. But a wheat machine, of modern construction, can thresh out and chaff from 300 to 850 bushels in the same time, and will cost from say \$225 to \$400, according to capacity. Not counting the delivery of the wheat at the barn or stack yard, as that has to be done both for flail and wheat machine, nor, for a like reason, the removal of the straw, and estimating the power of the machine at from four to eight horses-equal to from twenty to forty hands, with from five to eight hands to tend it, we have from 12 to 18 bushels as the average work of the hands, or an excess of work by machinery of from 70 to upwards of 170 per cent., to say nothing of the saving in wear and tear of laborers, of the substitution of a cheaper kind of labor, of the advantage in time gained for working other crops, of the diminished risk from weather, and numerous other incidental advantages. These items of calculation are never considered, but are assumed as true, their accuracy having been tested by long and established usage, and being acquiesced in rather than understood. A farmer would now as soon think in regard to the agricultural wants of the of grinding his corn with "two women at the mill" as of threshing his wheat without a As we feel very certain that there will be a machine. But it was not always so; the wheat called, and, we earnestly hope, a lengthy session machine fought its way to general acceptance

laborers, was exasperated to incendiarism.

The same principle of economy, in the true sense of the term, applies in greater or less degree to all other agricultural implements; and the mere cost of a machine is but a little matter, provided it accomplishes what it proposes. True, one machine may be cheaper or dearer than another of the same class; and particular machines-as reapers, all of which are patented at present, and bear a high price to remunerate the inventor-may be higher than the cost of construction, which is one element of competition in such cases, will justify; but as economizing labor very few good implements can be rated too high. In exigencies this is admitted by the practice of all farmers. Hence the popularity of these same reapers, which have brought enormous profit to their several makers or inventors. The necessity of cutting the wheat crop in a given time, like the necessity of threshing it, compels the presence of the most expeditious means for the purpose.

But it can hardly fail to strike one that the necessity of sowing a crop in good time, and on the most suitably prepared seed bed, is not less necessary to the great end of cropping than the need of proper means to sever the crop from the ground, or to prepare it for market.

Among implements of this class, which may be called really great inventions, Crosskill's Clod-Crusher is entitled to a high place. Its name is its best description, as its performance is its highest eulogy. It does not pulverize clods, though there is as much resulting dust and fine soil as from the action of the best harrow; but it reduces them, the largest and hardest, without difficulty, into minute and manageable fragments, leaving the harrow in this respect completely in the shade. Indeed, it accomplishes, at one traverse, what the harrow can never accomplish at all, as the following description will prove:

It is a roller six feet long and thirty inches in diameter, weighing about two thousand But unlike most rollers, which are either a solid cylinder, or, at most, a cylinder in two or three sections on the same axle, this imptement is composed of twenty-three independent serrated wheels of cast iron—the teeth standing out like cogs, but reduced to an obtuse cone or boss at the point—"supported on four feathered arms"-each alternate wheel of some tirely in doing.

against an opposition, which, in the case of the three inches less diameter than the otherswith an eye formed in the centre fitted to move easily on the common axle. But the eye of the larger wheels is expanded to such size as to give them a play of several inches on the axle, which is guarded at such points by a revolving collar, fitted to catch the wheels as they descend. Perpendicular to the angle of each tooth, on both faces of the wheel, is a small cast iron wedge, or flange, which, as the clod breaks, drops down on it and splits and mashes it into smaller fragments. With its weight and momentum, its cones and wedges, its vertical play of the larger wheels, and lateral play of all, it is evident that it must be a powerful implement, and capable of reducing the most intractable clods.

> The common roller, if it does not crush the clods at once, presses them into the ground where they lie unbroken, and affording no soil for the plants around them to feed in, or are again dragged up by the harrow; or, in very hard clods, it bounces from one to another, breaking only those that it strikes with some impact.

> The harrow frequently passes by or over clods, and even when the largest are broken, which is by no means universal, their fragments become rounded by attrition with the harrow teeth or with each other, and further harrowing is useless as to them, and pernicious as to the soil.

> The implement in question does neither. If a clod is pressed into the ground it is just in the best position to be crushed; and so far from slipping away from it clods are frequently caught between the surfaces of the wheels, lifted up and ground to powder-in this way we have more than once seen a broom-straw tussock completely ginned of the indurated dirt that enclosed the roots—the whole surface is reduced to a mass of dust, fine dirt, and clods about the size of a hen's egg or less, and left just in the best condition to receive the seed, and allow of the best action of the covering harrow. The track of the machine presents much the appearance of sheep tracts over a mellow surface.

> It thus combines the action of the roller and harrow into one implement, and performs at one working what both of them often fail altogether to accomplish, and never succeed en

plement, a direct comparison of its work with that of the harrow and roller. A simple inspection satisfied us that was as useless as to estimate the relative speed and power of a locomotive and an ox cart; but a friend-D. W. Haxall, Esq., of Charles City county, who obtained a clod-crusher on our recommendationinforms us that a neighbor of his, who witnessed its operation, after having been at work on his own farm in the usual way, conceded that the land was better prepared, and the wheat better seeded by Mr. Haxall, with the equivalent of nine harrowings on a fifteen foot bed, than his was with nineteen harrowings on the same area. At this rate, in sowing a hundred acres, it would pay for itself in one seeding.

A simple statement will prove its economy. A three horse harrow, sweeping five feet, must lap one half at each trip, making only two and half feet of work. Supposing one rolling with the smooth roller to complete the work, which it never does, then three trips of the three horse teams are necessary to do what the clod-crusher, with four horses, does in strips of six feet at one trip. To get a thirty foot bed in order at this rate, would take twelve trips of the harrow, five of the roller-seventeen of both. But the crusher does the same work in five trips. thereby operating an excess of work of two hundred and forty per cent., or seventy per cent. more than the thresher in the case supposed. [It is perfectly fair to offset the driver saved against the extra horse.]

As to cost, a harrow will cost \$14, and must be renewed every five years; a decent plantation roller, renewable as often, costs not less than \$10. But the clod-crusher will last, upon the most moderate estimate, at least five times as long as these implements, being nearly indestructible. Here, then, we have a cost for harrow and roller of \$120—to say nothing of the worry and bother of repairs—against a cost of \$140 for the clod-crusher, which is shown to do an excess of two hundred and forty per cent. of work.

In saving another most tedious and vexatious process, that of breaking clods with the edge of the hoe after the wheat is seeded, it is still more efficacious and satisfactory. On some stiff clay farms this is indispensable more or less every year. Let any one estimate how long it will take a hand to break the clods on a breadth of

We have not made, in any trial of this imement, a direct comparison of its work with at of the harrow and roller. A simple inection satisfied us that was as useless as to timate the relative speed and power of a

It performs also another important office in fitting the land for the reception of clover and grass seed. Every one knows that a slight depression in the seil, the track of a wheel, a horse, a man, a sheep, is the best receptable for these minute seeds. With the clod-crusher the whole surface is dotted with them.

Still another most important service will it render in compressing light surfaces, and giving them a closeness of texture which the simple roller can not effect, not only by its superior weight, but by the trampling of so many cones over the surface. For this purpose it is used extensively in England, and by many thought even more valuable on light than on heavy lands.

It is worked by four good horses or mules—at least we have worked it with that number—but five or even six is better. With the largest number it is a cheaper implement by far than two three horse harrows, and will save a driver.

It is made by Messrs. Baldwin & Cardwell, who have obtained their patterns from our castings, and make a better implement than our's is at a cost of \$140.

Let those who wish to buy, and yet think the price high, pay us a visit at Summer Hill, where we can work it any time on half an hour's notice; and if they are not satisfied to buy one we promise them a dinner, supper, night's lodging and breakfast, for nothing.

We got the Virginia State Agricultural Society to assist us in importing the clod-crusher; they importing at their risk, with the understanding that we were to take it at cost if it answered. We have never seen the day we would have taken the cost for it. And Mr. Haxall, and Mr. Chas. B. Williams, who also have one, each hold theirs as highly.

Persons may confound this implement with one made in Baltimore by Sinclair, we think—a much less costly and lighter article, and quite a good one, though very high at the price. But it is not to compare to Crosskill's in efficiency, strength or durability. We have tried them side by side, and for real work we would as soon think of matching a calf against an ox.

farms this is indispensable more or less every year. Let any one estimate how long it will what long, and possibly, prolix. We could not take a hand to break the clods on a breadth of make it shorter, and yet say all that we wished

by way of testimony to the implement, or inducement to its purchase. If public spirited gentlemen will examine for themselves we shall be satisfied. If our subscribers in the Valley may feel an interest in the subject—we should they would, for they have clods as large as nail kegs-they are referred to our friends, H. M. Nelson and Nath'l Burwell, Esqrs., of Clarke county. They have seen it work, and have engaged patterns of the maker in Richmond. Those wishing to obtain them in time for use this Fall, will have time to see Messrs. Baldwin & Cardwell-consult Mr. Cardwellin Richmond.

# ANNUAL ADDRESS FOR THE STATE AGRICULTURAL SOCIETY'S FAIR.

We omitted, accidentally, in our last issue to mention that Dr. WM. H. McGuffey, Professor of Moral Philosophy and Political Economy at the University of Virginia, had consented to deliver the annual address before the Virginia State Agricultural Society at its next meeting. We congratulate the Society on the selection that has been made. We think Dr. McGuffey the finest thinker it has ever been our good fortune to hear, and no doubt his address will be a treat to those who can appreciate it.

# SOUTH CAROLINA AGRICULTURALIST.

We have accidentally omitted to notice the revival of this very valuable agricultural journal, this time under the auspices of the newly formed South Carolina Agricultural Society. It is edited, as before, by Col. A. G. SUMMER. We were sorry when it was discontinued sometime ago-we place it again on our list of exchanges with very great pleasure. We like the editor.

### "THE GREAT GUANO DISCOVERY."

Possibly some of our readers may not have forgotten an article we wrote on this subject a few months ago. We heard that we were to be answered, and tendered the Planter as the medium; but heard no more of it. We have lately understood that the thing blew up; that the guano turned out upon analysis to be worth about as much as our title to the Lobos Islands did upon investigation.

What amount of stock was sold in Virginia fall considerably short of an average. we have never ascertained.

# AGRICULTURAL AND COMMERCIAL REVIEW.

In this State the wheat has all been harvested, and is now safely garnered in the farmers' barns, excepting of course, the limited quantity which has been sent, or may be in transitu to market. We have no definite information as to the extent of the crop, in Virginia, but believe that the annexed general review, from the Whig, of this city, is, in the main, correct:

"The wheat crop in Tide-Water Virginia is far inferior to any for ten years. In the Southern part of the State, from Powhatan to the North Carolina line, the crop, with some, and those very few, exceptions, "is miserable." The Piedmont country—extending from Alexandria along the foot of the mountains, to Franklin-fifty or sixty miles in breadth—the crop is generally very good-though produced at a heavy expense in guano. In the lower portion of the Valley the crop is fair-in Rockbridge, almost a failure-further west, in South-Western Virginia, satisfactory. A general alarm, from the mountains to the seaboard, is felt for the corn crop. The rains have been partial and limited in quantity; the chinch-bug universal, and like the sand of the sea-shore for numbers. Many corn fields are entirely destroyed by them already, and others can only be saved by timely and copious rains."

In the July number of the Planter, we intimated that the corn crop would probably be an abundant one. From information which has since reached us, we are led to the conclusion that the reverse of this presumption will be nearer the truth. In Eastern Virginia there has been no rain of consequence for six weeks; the chinch-bug as the Whig states, has made its appearance everywhere, and, in short, if the half we hear be entitled to credit, corn will be a scarce article in Virginia next fall. The corn crop in the Western States has fared rather better, but there is no doubt, but that from various adverse causes, the yield will not begin to equal that of last year. In various localities, the seed failed to germinate until after two or three plantings. From Europe, the accounts are, as usual, conflicting. In England and the Southern part of Scotland, the prospects are favorable, but on the Continent, which has recently suffered from calamitous inundations, fears are entertained that the cereal yield will

The first new wheat sold in this market,

freely, and the millers are still paying \$1 75 to \$1 85. The "Gallego" and "Columbian" Mills have re-commenced operations for the season.

Groceries and provisions still command high prices. Bacon has advanced about 2 cents per pound since our last.

July 28th.

Since our advertising department was put to press, we are requested to say that the sales advertised by D. J. Hartsook, agent for Mrs. Cabell, have been postponed. The sale in Lancaster county to the 4th September and the Lanevile property to the 18th September.

See advertisement of "Lindsey's Double Acting Rotary Force and Lift Pump," on p. 5 advertising sheet.

# From the Richmond Daily Dispatch. RECEIPTS OF WHEAT.

Below we give a statement of receipts of Wheat in this city by Railroads and Canal, each week for the year, beginning on the 1st of July last. (In an annual statement published on the 4th inst., an error occurred by adding the receipts of one quarter twice, which the present statement corrects.) It will serve to compare with the receipts of the present year:

\*The mills ceased grinding, after having ground about 300,000 barrels during the season.

† Nominal; no wheat of consequence offered during the three weeks.

† Contracts for new crop at \$2. § A few additional contracts made for "future delive-

ry."
\*\*For "July delivery." th New crop began to arrive; and prime sold for \$2. # All the mills again in operation.

# GENERAL NOTICE.

In accordance with the notice given in a previous number of this paper, we commenced with the July number to drop from our list, all

subscribers who are in arrears for three years or more, and shall continue to do so until the first of January next, at which time we intend to drop all who are then in arrears for two years and upwards. But in doing so we do not intend to relinquish our right to collect our dues from such delinquents, but shall send out their accounts regularly or place them in the hands of Agents for collection. We do not design to adopt strictly the cash system, but we desire to approach as near to it as possible, and wish our "Terms" which are printed conspicuously in every paper to be understood by all our subscribers. They are as follows:

# to le good a me : TERMS.

ONE DOLLAR and TWENTY-FIVE CENTS per annum, or ONE DOLLAR only, if paid in advance. Six copies for Five Dollars; Thirteen copies for TEN DOLLARS—to be paid invariably in advance; and to them we mean strictly to adhere with this variation only, subscribers who owe for two years, or \$2,50 and remit, \$5 will be credited for two years of arrearrages and three years in advance. We think no one who intends to pay can object to this arrangement.

# RANDOM THOUGHTS UPON THE USE OF GUANO.

Mr. Editor:

The frequent inquiries and reports as to the use of guano seem to indicate that it is suspected of possessing some peculiar magic power different from all other manures; it is apprehended that if it was relieved from this suspicion, its use would be better comprehended, and consequently its benefits would be more diffused. The writer has long been perfectly satisfied that its properties, and as a consequence its action, are exactly similar to all our concentrated animal manures, more particularly those of the stable, and the poultry yard, in exact proportion to the concentration of their fertilizing principles, and that if either of these may be regarded as permanent manures, then may guano be. It appears almost, if not entirely, a self-evident proposition, that it any fertilizing agent, is applied to the soil, with all its elements of nutrition, eliminated and prepared to be appropriated by the vessels of the plant; and in quantity not exceeding the wants of the plants, and the sea- appropriate and retain, and if cropped in son be such as to allow the full develop- this state, with the aid of the moisture, will ment thereof, that the land can receive no vield to the crop what it would otherwise

fertilizing benefit. Guano is in this state of perfect elimination, and consequently promptly answers to the demands of the plant, and if these exceed the funds in the treasury, it runs dry and must be silent as to farther calls. Those who have used guano with tolerable liberality, have found, that for the most part, the growing plant has not exhausted the supply, and that enough has been left to show a decided improvement in the soil. The writer testifies to the fact that three successive crops, tobacco, wheat and oats, have been made from one application. An acre of poor "old field" was added to a tobacco lot: the lot was manured as usual with stable and stable-yard manure, and the old field with guano alone, about 200 pounds to the acre. Cultivation the same on each—a good crop on each. The guano part, thought by some, best-seeded in wheat after the tobacco-a good crop with similar comparative result, the spring following, was fallowed, sowed in oats with like result, leaving the land guanoed equal in appearance to the old lot along side: Does this evince permanence? If not, it is asked, what may be so regarded? Virgin fertility may be tired or exhausted; and so may any manuring. The exceedingly subtle and evanescent character of guano may be, and, by the writer, is, regarded as all a mere notion.

All good lands have certain properties in common, whose constant tendency is to seize and appropriate such fertilizing elements as may be brought within the sphere of their attractions. The limit of their capacities vary, but all will, if allowed, attract and appropriate to the full extent of their capacity; and will retain that degree of fertility, if not wantonly wrested from them. In what this property of selfrecuperation consists, no attempt is made to define, but men of intelligent observation can scarcely fail to know good land when they see it; all such, if exhausted by cultivation, and left to rest will readily seize and appropriate such fertilizing materials as may be brought within the range of their appetencies, and will hold to the full amount of their capacity of appropriation. All lands may be stuffed-surcharged with manure, more than they can

give to the atmosphere. The essential, difference between good and sterile soil consists in the abundance or paucity of the elements which constitute the property of self-recuperation. A legitimate inference from this view, observation has established as a fact—that soils originally sterile do not retain manures, and from any ordinary degree of artificial fertility, rapidly relapsed to their virgin poverty, this they will fall to without the aid of cultivation. All our domestic manures contain much undigested material (some more, some less) that avails nothing for the first crop, but is left in a process of preparation for after help to the soil. Hence these manures get the credit of more permanence, merely because a large portion was not sooner available for the sustenance

of crops. What is new in the experiments reported in the last Planter by a citizen of Buckingham? Is it not evident, that in the case of the two lots where the guano was applied before planting, the supply was insufficient to meet the demands of the overgrown stalk, and ear too, and in the last case, the supply was afforded just in time to meet the wants of the ear, and was expended on that instead of the stalk! It is feared that this report may lead some to the erroneous conclusion, that it is best in all cases to apply the manure at the time of laying by. The writer has applied guano and other manures to corn and tobacco during the late workings with very satisfactory effect, and cheerfully testifies to an assurance of profitable results if the season be sufficiently moist. Any quantity short of a full and thorough supply, will, with a moist season, accomplish more if applied at the last working than before planting; but if the season prove dry, it will avail but little at best and will often prove injurious. It is no new thing that partial manuring of corn is likely to produce a large stalk and small ear; and this it will most certainly do, if the early season be a very pushing one. If regard is had to the greatest certainty of a crop and improvement of the land, a full supply, broad cast and thoroughly incorporated with the soil is the best mode of application. This holds good with guano as well as other manures. In using guano, with regard the amount of crop, especially, it may be good economy to retain a portion of the

third, for a late application to corn or toacco. This has been tried by the writer with very satisfactory results.

Your Buckingham correspondent should have stated the character of the season in which his experiment was made. It may not occur to all that the early season must have been abundantly moist-giving the vigorous stalk and thereby exhausting the manure, and the latter season must also have been moist, or the late application would not have given the larger corn. About as profitable results may be expected from turning a beef into a barren pasture for the summer and fall which had luxuriated all the spring in a rich clover field, as from a partial manuring in the hill or trench, with the early season, moist and pushing, and the late dry and back-

CEDAR HILL, Charlotte Co., July 21.

# [For the Planter.]. NICHOLAS LANDS, SHEEP, &c.

Mr. Editor .- Being on a tour through our Western counties, I cannot resist the opportunity to speak of the lands of Nicholas county, their fertility and peculiar adaptation to sheep husbandry. I would premise by saying, it is singular that persons desiring a change of loca-tion should have overlooked this healthy and desirable section, where lands are not only cheap, but of surpassing fertility; but, I presume, this has been chiefly owing to its being cut off, as it were, from the main channels of communication, and from erroneous impressions which have gone abroad in relation to the poverty of the county. The sparseness of population has been owing to the lands being held in large surveys, and the uncertainty of title; this state of things is fast passing away. Settlers of the right stamp are rapidly coming in, chiefly Eastern Virginians; forests are falling before the woodsman's axe, valleys becoming clothed "with living green," and roads and means of communication extended. I am informed that lands have advanced from one to two hundred per cent. in five years, though now nominally very low (unimproved three to five dollars, improved eight to twelve dollars). left Gauley bridge and travelled up Gauley and Peters' creek, by the Gauley Bridge and Weston Turnpike, to Summersville, the county seat. The road, on each side, is hedged with what appear steep and rugged mountains, though the land on the stream was of unsurpassed fertility for corn, grass, sweet potatoes, &c.; but wherever a stream descends, you find coves of welllaying fertile lands, of from two to two thousand acres, clothed with sugar-maple, pawpaw, &c., with but sparse undergrowth, when not cleared; amount designed to be pplied; say one but many of these coves have been converted

into smiling farmsteads—the log houses in the to be almost incredible. This is superior grass valleys surrounded with luxuriant meadows and land, and lays well for farming purposes. Most the hill-sides clothed with grain. Some of the of this section has been purchased, two or three best grass farms I have seen in the State are in these coves. Burk's Garden, owned by the ginia, at two to three dollars; that offering for Messrs. Raders, is certainly unsurpassed for sale is held at five dollars. If improved, this fertility, besides many others. Nicholas Courthouse, or Summersville, is quite a thriving grazing purposes. Crossing on to Cherrytree, village, and bears the marks of much recent we passed the improvements making by Mr. improvement, owing, it is said, to the energy, taste and enterprize of Dr. Price, formerly of Mecklenburg county. They sadly need a court-house, but the people have been over taxed to make roads, and require a breathing spell. They paid four hundred per cent. on revenue tax for the completion of the Gauley Bridge and Weston Turnpike, besides working from ten to thirteen days on the county roads.

From the courthouse I went up Muddletee, which has some fine farms, with superior meadows, as also the streams making into it. The lands on Birch are equal to any lands in the State for corn, wheat, tobacco, as also the lands on Elk river. This is a beautiful stream, and can be made navigable for steamboats to Sutton at a reasonable outlay. Its banks abound in the richest iron ore; cannel and bituminous coal. Crossing from Elk, by Sycamore, Twenty mile creek, there is some good land, and some as rough and barren as any in the State. Recrossing the turnpike, we passed up Laurel creek to the section known as the Meadows and Panther Mountain, which affords evidences of high cultivation—being thickly settled in small farms, which show unmistakable evidences of thrift and plenty—land sells higher than in doubt not other sections. The wilderness is lately settling pleasure. up, but is rapidly becoming opened; new farms appearing on every hand. Returning to the courthouse by the "Open Rocks," the greatest natural curiosity in the State, we passed into the Kentucky settlement, over a miserable ford is destined to be the best county in the State. at Gauley river. This section is very productive and has some fine farms. Much unimproved land is still unsold in this section, belonging to S. McD. Moore, Esq., of Lexington, of superior quality. Recrossing Gauley at Persingen's run, we went up Glade creek, but this, to me, seemed cold and crawfishy, and the timber—white oak—shows evidences of frequent frosts. McMillan's creek is one meadow, and such meadow! yielding one and a half to three tons of hay per acre. Crossing over to Beaver and Stroud's glade, we found some beautiful land. Callaghan had a fine survey, but has sold off much; the best has been bought by Maj. T. G. Harris, and Mc-Farland, of Richmond. There is still much good land in this section unsold. There is, from this up to Fork Lick, much very superior unimproved land-limestone-and if ever the Slaving Cabin road is completed, will be one among the best sections of the county. Recrossing Gauley at Cranberry, we examined the lands between this and Williams's river. This is high

land would be worth fifty dollars per acre for. Morris, Hon. R. M. T. Hunter, Messrs. Garnetts and others, well known East; they will soon have fine farms. From this to Meadow river, and Greenbrier settlement, is a wilderness, though said to contain some superior farming and grass lands. The whole county is alpinewith rich vegetation to my eye, seems peculiarly adapted to Sheep-Husbandry. It is superior grass land, and remarkably adapted to farming, that all important auxiliary of sheephusbandry. The flocks of native sheep presented an uncommon fine and healthy appearance. Dr. Price, we understand, has introduced some superior imported Cotswolds, and is arranging for a large flock of Silesian Merinos. This move will be all important to the future of the county; and we doubt not, in ten or fifteen years, that this will be the largest wool-growing county in the State.

I would advise all persons, desiring to change their locality, to visit this county, especially Elk, Fork Lick, Cranberry and Cherrytree, they will find superior lands at three to five dollars. Those visiting that region would do well to consult with Maj. T. G. Harris and Dr. Price, both gentlemen from Eastern Virginia, and who, I doubt not, will give every information with pleasure. The society now moving into the county is of the very best, and this will add much to the future value as a permanent home; indeed, take it all in all, Nicholas possesses, within herself, the amplest resources of wealth, and

I have written the above with the view of calling attention, of those desiring a change, to this county; they have only to see, to be as highly pleased as

COSMOPOLITE. N. B.—Those visiting this region must not expect to find houses, etc.; all, nearly, live, as yet, in primitive log cabins, but give you an Old Virginia welcome, feasting you on the best from field and wood. I may write again, during my tour through this terra incognita.

# For the Planter. MANURE OF FLESH.

Mr. Editor.—By request of F. G. R., Esq., I advertise my mode of preparing and using manure made of dead animals.

For the last ten years I have leased my lands, except my present residence, where I attend exclusively to grazing, without manure. When I did farm I had a vault for dead animals, about table-land, of unsurpassed fertility; the timber eighteen feet square and six feet deep. This of such size—poplar, black oak and walnut—as was made in clay grounds, immediately below

furter enrich the mass. In this vault I cast, annually, about two horses, four or five cattle, twenty or thirty sheep, and perhaps a goat, dog, or cat. These animals were cut into pieces with an axe and spread on a layer of vegetable mould, saw dust, or charcoal, or a mixture thereof. On the flesh I cast ashes or lime, and then immediately a layer of absorbents as above mentioned, say sixteen or eighteen inches thick. carcase of a horse or cow should be spread over the whole face of the vault, but smaller animals must be used up as reflection may suggest.

A vault of the size above mentioned will hold seventy-two square yards of manure, which would be about the proper size for the number of animals above specified; but I found that by the addition of the urine my manure was too much concentrated for broad-cast field purposes; therefore, had I such work to do again, I would

enlarge my vault.

One having no clay grounds near his cattle yard, should make his vault with plank; and it would be best to have two vaults, one near the cattle vard, and one near the stable .-What I mean by cattle yard, is a permanent enclosure for winter. And here I might (if admissable) bring up the question, whether it is best to feed cattle in a yard, or on open grounds?

This kind of manure is made principally in the latter part of Winter and early Spring; when our animals are inclined to die from starvation and cold; and for two reasons should not be disturbed until the beginning of next winter; first, that the mass may be completely decomposed and compounded; and secondly, that the

effluvia may not be offensive.

And now comes the questions, when, where, and how should this kind of manure be used?

I have said above that the contents of the vault should not be disturbed until the begining of winter, say December, when it should be cast out; leaving one side of the vault open for ingress with raw materials. For the purpose of saving expense in transportation, my rule has ever been to spread my heavy manures, of whatever description, on grounds or crops near the heap; and to cast lighter manures, such as plaister, &c., on distant grounds. If I had a grass plot or wheat field convenient, I spread my vault manure on the poorer spots thereof, immediately after casting from the vault. If no meadow or wheat near, but land intended for corn or tobacco, I reserved the pile for this or these; to be spread immediately before fallow-ing. If none of the above be convenient, I capabilities. It has been remarked in elucidaspread my heavy manures on the first poor spot I come to, and await my profit at the next round of cultivation. The greater portion of our powers separately, cannot effect: the persons arable lands are unproductive because of the engaged in farming being necessarily dotted want of vegetable matter; and it is a question over the surface, do not find the same magical worthy of much consideration, whether, with influence of association: the disadvantage is this object in view, it is not best to manure our greatly overcome by the superior industry the

my cattle yard, that the stale and surplus urine this mode, and never had cause to regret it. Refrom the yard should run into the vault to member, reader, what I have frequently told you: "Can't you wait awhile for your interest, till it is worth drawing from the bank? Better starve a few years and then be free, than always half starved."

I incline to the opinion that manure made of flesh is peculiarly adapted to the production of grass; therefore say, that no farmer should be without a manure vault and a meadow near that vault. Orchard grass and red clover grow and ripen well together, and by the application of the above manure and plaister, could be cut twice in the year, yielding altogether without the aid of foreign water at least four tons of hay, worth in our markets eighty dollars.

The bones not decomposed, should be cast

back into the vault for a second round. Absorbent materials should always be ready to hand. Do not cheat by selling a worthless horse, cow, or sheep, but kill it to keep it from

dying, and put it into the vault.

Look about your houses, your ditches, your roads, and under your old fences, for vegetable mould, and you will certainly find abundance. Perhaps one may not have saw dust, no matter. If you make coal for the above purpose, burn as usual, but when burnt do not draw as usual, but pour a few pails of water down the centre, and close every pore for eight or ten days, when the fire will be extinguished and the coal sufficiently pulverized for use. If ashes or lime be plentiful or cheap, then use one or both in liberal quantity; but a small quantity will suffice if applied directly to the flesh; indeed, if neither can be conveniently had, then I say neither is absolutely required. Pay no attention to the jargon of Mr. Jothead, but go to work according to the dictates of reason-I mean, when he says pity or shame.

Z. DRUMMOND. July, 1856.

# REPORT.

To the Locust Bottom Botetourt Agricultural Club. [Published by Order of the Club.]

The undersigned, appointed by the President, to present a retrospect of the Club, and what is in prospect of accomplishment, will en-

deavor to be brief.

It is a striking feature of the age, that every thing suitable is carried forward by association. Individual and isolated efforts have given place to combination: perhaps the rapid strides on the road of improvement, may be attributed to this salutary charge in the business of life, tion of this idea, that two individuals combined can roll a log that one hundred, applying their lands at least one year in advance of cultiva-tion. When a farmer, I frequently practiced other callings, the farmer's life make a pleasvarious agricultural operations, we feel bound to scrutinize, we derive information and confidence from a source we cannot impeach or call

in question.
With the augmented demands which the progress of the age is making upon our exertions in the way of comfort, prudent show and enlarged list of luxuries, also in furthering the cause of virtue, education and neighbourly reciprocity, we should be inert if we were not awakened to a sense of our relations and duties in the social fabric.

Among the advantages, our association may claim to impress on its members, in a degree, but not proportioned to its merit, is the importance of drainage: manuring from any and every source, by purchase as well as collections on our farms; deep fall plowing necessary to invite the disintegration and amelioration of the soil, by the winter's frost; returning to the soil green crops, grown with that object; a judicious rotation of crops, the succeeding crop requiring from the soil a different element in the main to perfect it from what the preceding crop had appropriated: and last but not least in importance, to arrange to have certain products profitably consumed on the land, that the resulting offal may be returned to the soil.

When we have accomplished what may be anticipated from present prospects, we will be behind in the public improvements that are in progress of completion; a development of our resources is indispensable to sustain those improvements: in good faith we should develope the resources of the country to meet reasonable

anticipations.

A large item in estimating the value of a country, is the local attachment of its inhabitants. We shall act wisely to do all within the power of each to flx the attachment of the population to the soil, and transmit that attachment to our descendants: among the things that may be reckoned to have that influence is, fruit of every suitable variety. We present it as an object deserving prominent consideration, as a monied crop, and one that will not deteriorate the soil: the canal, of all is the most suitable mode to convey such a crop to market. We would sugges that if the capacities of our country were developed in this regard, the result would exceed what would result from raising stock; in furtherance of this earnest view, we recommend that the funds accumulated in our treasury be disposed of in obtaining fruit trees of valuable varieties suitable to our climate and localities, as the nucleus of a lasting monument on our respective farms of the utility of our association.

In looking forward to duties to our descendants in transmitting enduring advantages to them, we select as deserving most consideration, a highly improved soil with appropriate conveniences. Fixed habits of industry, and a high intelligence to give that industry a proper di- from eight to twelve hours to rise.

ure and a recreation: by consulting with each rection—as superior to money and promising as other, and by frequent observation of the many advantages as may endure in human hands.

> In the words of the preamble to our constitution we claim to be in search of the way to "improving our soils, augmenting our crops, making our farms more desirable, fixing upon the most appropriate crops, suggesting the best arrangements to bring about the greatest prosperity and convenience, of avoiding the loss of leaving off abruptly any one crop or system, that time and circumstances may point out as judicious to abandon, and instead to glide into new ones as holding forth most promise of remuneration for our labours, also of promoting virtue, sociability and friendship."

> If we have been able in our short history to find the road that leads to such results, we may congratulate ourselves upon our success, and in good time will reach the goal of our hopes. Respectfully submitted,

HOBSÓN JOHNS. MADISON GILMORE, RICH, G. HADEN.

### A NOBLE PROPOSITION.

A subscriber who sends us the name of a new subscriber with the "eash in advance," says: "If all your subscribers would pledge themselves to send one new subscriber every year, it would swell your list, [certainly it would—the very thing we want ] - aid the cause of agricultural advancement, [beyond a peradventure]and put them to little or no trouble, [not the least, but on the contrary save them an infinite amount hereafter - I will pledge myself to do this." Now, how many of our subscribers are there who are willing to "pledge themselves" to "go and do likewise?" It would give us "little or no trouble" to add ten or twenty names daily to our subscription list, but would afford cheer and consolation to our weak and flagging spirits this excessively hot weather, especially if accompanied with a "little material aid." Come one, come all! you can't come too "fast" for us.

The list of payments for this number is necessarily crowded out.

Dyspersia Bread.—Three quarts of unbolted wheat meal; 1 quart of soft warm water; 1 gill of fresh yeast; 1 gill of molasses; 1 teaspoonful of saleratus. will make two loaves and should remain in the oven at least two hours. It will need

THIRD SESSION 1856-52

THE THIRD ANNUAL "COURSE OF LEC-TURES" will commence on Monday, Oct. 13th, 1856, at the College Building, corner of Marshall and College streets, Richmond, and terminate on the 15th March 1857, being a session of more than five months. Surgery and Surgical Anatomy, by CHARLES BELL GIBSON M. D.

Theory and practice of Medicine, by DAVID H.

Chemistry and Pharmacy, by MARTIN P. Scott, M.

Materia Medica and Therapeutics, by B. R. WELL-

Anatomy, by ARTHUR E. PETICOLAS, M. D. Institutes of Medicine and Medical Jurisprudence, by LEVIN S. JOYNES, M. D.

Obstetrics and Diseases of Women and Children, by James H. Conway, M. D. Demonstrator of Anatomy, by Theo P. Mayo, M.

The study of Practical Anatomy may be prosecuted with the most ample facilities and at a very ti-

fling expense.
Clinical Lectures are regularly given at the College
Infirmary and Richmond Alms-house. The Infirmary, under the same roof with the College, is at all times well filled with Medical and Surgical cases, and furnishes peculiar facilities for Clinical instruction.

Many Surgical Operations are performed in the presence of the class, and the Students being daily admitted to the wards, enjoy, under he guidance of the Professors, unusual opportunities for becoming familiar, not only with the symptoms and diagnosis of disease, but with its daily progress and treatment.

\$105 00 .5 00 Amount of Fees for Lectures, Matriculation Fee, 10 00 Practical Anatomy, Graduating Fee, 25 00

The price of Board, including fuel, lights and servants' attendance, is usually \$3 or \$3 50 per week. The catalogues, containing fuller information concerning the Institution, will be forwarded to those who apply for it, or specific enquiries will be answered by letter.

# IMPORTANT SALE Of Real Estate and 225 Negroes at Public Auction.

I offer for sale two very valuable estates in Lancaster county, Va., on the Rappahannock and Corrottoman rivers, known as Indian Town and Hill's Quarter, the first containing 1620 acres, the latter 1473, chiefly low grounds, and very productive in the staple crops of that section. On these estates are beds of marl and oyster shells, with which they may be made as productive as

any in the State.

Indian Town is now highly improved, and the other rapidly improving, and lying as they do immediately on navigation for vessels of the largest class, with a large portion of forest, the timber and wood alone would readily command a large portion of the purchase money. The oysters and fish, for which Carter's creek is proverbial, yields also a good revenue. I desire to sell the estates with or without a force to work them, with the growing crops and everything to stock them, and would sell privately. If not sold however, will sell them to the highest bidder, commencing at Indian Town, on THURSDAY, the 14th day of August next, continuing frem day to day till completed.

Should the farms be sold privately, with negroes, &c. to stock them, still I will sell to the highest bidder, commencing as above, at least 100 valuable slaves, together with a large amount of personal property, of

every description, on said estates.

I will also rent for the ensuing year, or for a term of years, the estate known as Corrottoman, containing 1785 acres. Also, would hire the force to work it, and sell the growing crop, Will also sell the surplus slaves. Also, all the stock of all kinds, farming uten sils &cc.

And, on THURSDAY, the 4th day of September | Sold by PUR next, at Laneville, near Warminster, Va., I will rent gists generally.

out the Laneville farm, and with it hire a moderate force to work it, and if the growing crop be taken, will sell the stock of all kinds and other personal property.

Also, at the same time, will sell some 40 or 50 slaves.

There are many valuable blacksmiths, carpenters, &cc.,

on all these estates.

TERMS—The land and any negroes sold with it, on long credit, if secured satisfactorily. The negroes for cash. Other property six months credit.

The managers on each estate will show them. address: Howardsville, Va. D J. HARTSOOK. Agent for Mrs. Mary W. Cabell. Auglt.

# AYER'S PILLS.

A new and singularly successful remedy for the cure of all Billious diseases—Costiveness, Indigestion Jaundice, Dropsy, Rheumatism, Fevers, Gout, Humors, Nervousness, Irritability, Inflammations, Head-ache, Pains in the Breast, Side, Back, and Limbs, Female Com-plaints, &c., &c. Indeed very few

are the diseases in which a Purgative Medicine is not more or less required, and much sickness and suffering might be prevented, if a harmless but effectual Cathar while a costive habit of body prevails; besides it soen generates serious and often fatal diseases, which might generates serious and often lated diseases, which linguishave been avoided by the timely and judicious use of a good purgative. This is alike true of Colds, Feverish symptoms, and Billious derangements. They all tend to become or produce the deep seated and formidable distempers which load the hearses all over the land. Hence a reliable family physic is of the first importance to the public health, and this Pill has been perfected with consummate skill to meet that demand.

Among the eminent gentlemen who have testified in

favor of these Pills, we may mention.

Doct. A. A. HAYES, Analytical Chemist of Boston, and State Assayer of Massachusetts, whose high Professional character is endorsed by the-

Hon. EDWARD EVERITT, Senator of the United

States.

ROBERT C. WINTHROP, Ex-Speaker of the House of Representatives.

ABBOTT LAWRENCE, Min. Plen to England. JOHN B. FITZPATRICK, Catholic Bishop of Boston; also Dr. J. R. CHILTON, Practical Chemist of New York

City, endorsed by
Hon. W. L. MARCY, Secretary of State,
WM. B. ASTOR, the richest man in America.
S. LELAND & Co., Proprietors of the Metropolitan

Hotel, and others.

These Pills, the result of long investigation and study, are offered to the public as the best and most complete which the present state of medical science can afford. They are compounded not of the drugs themselves, but of the medicinal virtues only of Vegeta-table remedies extracted by Chemical process in a state of purity, and combined together in such a manner as to insure the best results. This system of composition to insure the best results. This system of composition for medicines has been found in Cherry Pectoral and Pills both, to produce a more efficient remedy than had hitherto been obtained by any process. The reason is perfectly obvious! While by the old mode of composition, every medicine is burdened with more or less of acrimonious and injurious qualities, by this each indi-vidual virtue only that is desired for the carative effect is present. All the inert and obnoxious qualities of each substance employed are left behind, the curative virtues only being retained. Hence it is self evident the effects should prove as they have proved, more purely remedial, and the Pills a more powerful antidote to disease than any other medicine known to the world. Prepared by Dr. JAMES C. AYER, Practical and Analytical Chemist, Lowell, Mass.
Sold by PURCELL, LADD and Co., and by Drug-

culars, ample certificates from some of the best millers, and any further information required will be urnished; also every ki old of Mill Machinery of the most improved character, sold by LINDSEY'S DOUBLE ACTING

Rotary Forc e and Lift Pump.

This Pump has just been patented in America and England, and far excels any pump heretofore invented; its peculiarities are simplicity. power and cheapness.—
Its simplicity: there is nothing about it but iron and cast metal, and it can be cast metal, and it can be taken apart and put up by taken apart and will last for an any one, and will last for an age. It has the power to raise water hundreds of feet. This pump is from 24 to 30 inches in diameter and must set in the well or water.—
Water rises in it by hand 100 feet per minute! For cheapness: a No. 1 pump. (for all ordinary purposes) complete, and fifty feet of pipe, costs but \$30! The handle at the top, turns the pipe and pump revolution full and every

twice, a ffording an abunt tant

supply of water with the least possible expense and labor. It is peculiarly adapted to deep wells, rail road stations, mining and manufacturing purposes. This pump does not throw water, and is guarded against

E. G. REX. freezing and rust. Practical and scientific men pronounce it as without an equal, for all that is here claimed for it. The Scientific American after saying it is ed for it. The Scientific American, after seeing it in operation, says: "This pump is very simple in construction, not liable to get out of order, durable, easily operated and economical; we regard it as an excellent improvement." Circulars, with an access operated and economical; we regain improvement." Circulars, with an account improvement." Circulars, with an account improvement." Circulars, with an account in and full description, sent fire of charge to all parts of the country. No. 1, has a one inch pipe: No. 2, 14 of pipe, \$30, \$42 and \$54; the No. 2 and 3 are design-much water is required. The subscriber is the general world, and exclusive Agent for New York. Orders plicit as to the kind of pump wanted, depth of well, tion. A pump and pipe weighs about 170 pounds. No charge for shipping or cartage. Wells over fifty feet JAMES M. EDNEY, Com. Merchant, and Merchant.

substitute for Peruvian equal immediate results, with permanent effect.

It will not be denied, that if a real su.
Peruvian Guano could be had at a less cost
neet with great favor from the agricultural to neet with great favor from the agricultural Every effort heretofore made to produce such a strute has signally failed, and the general character of all such substitutes has produced a very just present the consumers of Character and the consumers of the of all such substitutes has produced a very just prejudice among the consumers of Guano against all namunfactured fertilizers. This prejudice, however, with annot weigh against the article here offered, as will to be seen by the following against the article here offered as will to the seen by the following against the article here offered as will to the seen by the following against the article here offered as will to the seen by the following against the article here of the seen by the following against the article here of the seen by the following against the article here of the seen here the following against the article here of the seen here the s with ton of ~, per ton fo. T. J. Deane cannot weigh against the article here offered, as will be seen by the following account of its production. It does not partake of the character of a nostrum, but its offered free from all disguise. The sources from which its eference are obtained. Snowden in ples may be seen. is offered free from all disguise. The sources from which its elements are obtained are known to all to hence it is not a nestrum. This article is warranted to contain in No. 1, 8 per cent of Ammonia, and from 45 to 50 per cent. of Phosphate of Lime. In No. 2, 5 per cent. of Ammonia, and from 50 to 55 per cent, hose cent. of Ammonia, and from 50 to 55 per cent, hose cent. of Lime. These two elements alone give value to Peruvian Guano, in which they best in the proposihad containing a m pnate of Line. These two elements alone give value to Peruvian Guano, in which they exist in the proporto Peruvian Guano, in which they exist in the proportion of 16 per cent. of Ammonia, and from 25 to 30 of Phosphate Lime. Two facts in reference to the ef-Phosphate Lime. Two facts in reference to the effects of Peruvian Guano demonstrate that it contains fects of Peruvian Guano demonstrate that it contains a larger quantity of Ammonia than is needed, and less of Phosphate Lime than is required. The facts are, first, that its effect is limited chiefly to one crop, that it is transient in effect; secondly, that the product of it is transient in effect; secondly, that the grain is rarely, if ever, in proportion to the growth of straw. Ammonia produces the growth, Phosphate of Lime is the element which is required to develop the grain. Ammonia cannot permanently improve the of Lime is the element which is required to develop the grain. Ammonia cannot permanently improve the the grain. Ammonia cannot permanently improve the soil, because of its volatile nature, hence, no more required than is necessary for the present crop. Phosphare of the present crop. urred than is necessary for the present crop. Phoste of Line does permanently improve the soil, if
ficient quantity, as is demonstrated by the
Guano of any kind was known
the effect of Peruvian
of hones before

use of bones before the effect of Perus is plain. That the facts in reference to Guano do indicate the above conclusion; ould be grand on indicate the Now, if a Guano could be every intelligent man. Now, if a Guano could doubt applied in surprise use of bones before every interngent man. Now, it is equano coura be is containing less Ammonia than Peruvian, and double or containing less Ammonia than Peruvian, and double or more Phosphates, it would certainly be a desider turn. No Guano of the kind exists; but the end is attached. No Guano of the kind and the results of its activated in the whole article and the results of its activated. more Prospinates, it would exists; but the end is attum. No Guano of the kind exists; but the end is attum. No Guano of the kind exists; but the end is attum. No Guano of the kind exists; but the results of its actual in the present effect to Perution and are not only equal in present effect to Perution, but superior, as is shown by the testimony aptivion, but superior, as is shown to the spring crops, and whose reliability will not pended to this advertisement, by those who will they are recombination of the best be que wirely have a combination of the best known exten.

Ye revised Guano in the best Phosphatic Guanoes, which grees in the proportion of half and one-third and two-thirds to form the proportions of Phosphatics. the proportions of Phosphates and Ami. mentioned. If the farmer could make this tion as well as the advertiser, he would have the suresult, but he cannot do it, for several plain reasons. First, he cannot make a uniform combination, which is necessary, otherwise there would be an irregular distribution. Secondly he cannot make a minute distribution. Secondly, he cannot make a minute combination, which is equally important to secure the full benefit of the relative action of the elements, one renders the Guano nutely integrated upon the rom the original The process neene-the aci-

Guano is readily dissolved, and thus the plant can appropriate it as it is required. Now, it is plain, that the prejudice against nostrums and manufactured fertilizers cannot operate against this article, for it is offered free from disguise of any kind-the only secret about it being the process by which it is manipulated, which is purely mechanical, and is of no interest to the con-sumer. The only question for the consumer is, wheth-er he gets what he is represented to get? To this the er he gets what he is represented to get? To this the writer can only say, to those to whom he is unknown, it is and shall be kept to what it is represented, and he defies the contrary to be shown at any time, by any analysis or investigation that may be instituted. To those to whom he is known, he flutters himself nothing further will be required.

The Guano is furnished in bags, stenciled with the The Guano is turnished in bags, stenciled with the me of the article and the name of the manipulator, the marks No. 1 or No. 2. It is sold at \$45 per .000 pounds, in Baltimore, for No. 1, and \$40 r No. 2. It will be supplied in Richmond by sole agent; in Alexandria, by Nevitt & Fredericksburg, by A. K. Phillips. Sam at the above places, and pamphlets ore elaborate explanation.

# To Agricultural and Horticultural Societies.

E would particularly invite the attention of those PREMIUM LISTS, to our large collection of Agricultural Books, which are peculiarly adapted for Premiums.

The awarding of Agricultural Books in the place of small Money Premiums has been extensively adopted with the place of small whose premiums has been extensively adopted

and has given the highest satisfaction.
AD ANTAGES OF THIS PLAN.

It promotes the dissemination of MUCH NEEDED IN-FORMATION among Farmers.

It combines the Advantages of a Diploma with a Premium of Intrinsic Value.

It substitutes a Fermanent and Expressive Token of Honor for the pittance which is frequently humiliating to the recipient.

It avoids the fostering of a mercenary spirit among Competitors, and better comports with the dignity of an nonorable emulation between friends and neighbors.

We will be happy to furnish to applicants a Catalogue of our Publications, which we consider most ap-

propriate for the use of Agricultural Societies to Premiums, on which a liberal discount will be given.

ROBERT MOORE.

# SEYMOUR'S IMPROVED PATENT GRAIN DRILL.

THIS Machine is capable of sowing all coarse grain and all fine seed commonly sown by Farmers, from corn and peas down to the smallest seed, such as clover, timothy and other grass seeas, either broadcast or in Drills, and while it is the best Drill for wheat, rye, oats, barley, &c., it is just the thing to drill in fine dry fertilizers before putting in the seed-or, these fertilizers may be mixed with the seed, and all deposited

in the ground together.

Its reputation has been in advance of all othe r drills for the last six years, in the State of Ne w York, and it has six times taken the first, prize bestowed on Grain Drills by the Agricultural Society of that State, including the highest prize and diploma, at the great trial of implements made by that Society at Geneva, in 1852, It is one of the most simple in its cor/istruction and machinery, as well as the most convenient and durable of all Drills; and without dispara-ging others, it is believed to be better adapted to the various purposes for which such a machine is wanted, than any other impleme at known in America; and its value is greatly in creased from the fact that it is converted into, a Broadcast Sowing Machine, merely by removing the drill teeth and conducting tubes, which can easily be done in five minutes. A recerit improvement which prevents the shrinking and swelling of the wood from affecting the correctness of its operation, also adds much to its value.

Another and still more recent improvement called,

### SEYMOUR'S GUANO ATTACIEMENT.

Is expressly intended to meet the waints of those who wish to drill fine fertilizers into the ground with the grain, but prefer to keep such fertilizers in separate compartments till discharged from the box, when both seed and fer tilizers will No. 8, pass together through the same drill' tubes into the ground. There is therefore but little room for those who are well posted in relation to grain drills, to doubt that this is the cheap est, as well as the

### BEST GRAIN DRILL IN THE WORLD

They are usually made with nine teeth, eight inches apart. The wheels are high, and the seven teeth are now seldom ordered, where only trout will only add the names of the following is an increasing demand for those is an increasing demand for those with eleven those with nine and eleven there with sizes kept on hand but any teeth; there only sizes kept on hand but any teeth are the only sizes kept on hand but any teet

other size, and those with teeth any other distance apart, will be made to order.

PROLEST HOLDINGS

The Machinery is remarkably simple, permanent and easily kept in repair, and all the parts are so clearly presented to the view of the operator, that he can readily see if anything is not correct; and the grain falls from the seed box to the tubes (a space of several inches,) in full view, so that in passing over a field, he may be constantly assured that the seed is deposited as design ed.

The teeth are all placed in one rank, unless order ed to be put in two ranks. It is believed by tluose who have made experiments, and given the subject their careful attention, that the evils cau sed by lumps, stones, &c., being thrown by the teeth in the hind rank into the furrows made by the teeth in the front rank, are in most cases fe r greater than the advantages gained. This f act has induced the inventor to construct his double-ranked drill so that the teeth can all be placed in one rank, at pleasure, thus obviating in this drill the objection to all other two-ranked drills. The price of the drill with teeth in two ranks, is five dollars higher than those with teeth in but one rank.

If required to sow Plaster, Guano, or any other fertilizer, a Feeder should be added, for these are very apt to be damp, and if slightly

damp, the Feeder is useful.

If required to sow grass seed, while brilling, a light broadcast "seeder" is added, with which any seed, from wheat to the smallest seed, can be sown in front of the drill teeth, and is slightly covered by them. Clover and Timothy mixed is readily sown with this, and it is conveniently guaged to any desired quantity per acre. To convert it into a Horse Hoe, for hoeing drilled grain, a set of Horse Hoes, with shanks, like the shank of the drill teeth. With these addi-tions or "Extras," it is capable of sowing grass seed, hoeing drilled grain, and sowing plaster, ALL AT ONCE. The Machines are designated by number as follows:

	No. 1, 9 tooth,	\$90	00
	No. 2. do. with Feeder,	96	00
	No. 3. do. do. and Grass Seeder.	. 111	00
	No. 4, 11 tooth,	100	00
	No. 5. do. with Feeder.	106	-00
	No. 6, do. do. and Grass Seeder,	121	00
	No. 7, 9 tooth, with Guarro Attachment,	110	00
•	No. 8, do do. and Grass Seeder	, 120	00
	No. 4, 11 tooth, No. 5, do. with Feeder, No. 6, do. do. and Grass Seeder, No. 7, 9 tooth, with Guario Attachment, No. 8, do do. and Grass Seeder	100 106 121 110	00 00 00

They are made under the superintendence of the patentee and inventor, and we design to make every machine in all respects as it should be, believing it will contribute to our own interest so to do, and that if we put in bad work or poor materials, the injury falls heavier upon ourselves than it can upon the purchaser.

We omit hundreds of certificates and recominelidations of the most encouraging nature draught so light for a team, that those with only from the most reliable sources; and for referseven teeth are now seldom ordered, which only the most reliable sources; and for referseven teeth are now seldom ordered, which only the manufacture of the following

# The best Book for Agents!

To Persons out of Employment.

Gift for a Father to present to his Family.

Send for One Copy, and ry it amo friends. Wanted—Agents to curvulate try it among your

SEARS' LARGE TYPE QUARTO BIBLE,

For Family Use, entitled

### THE PEOPLE'S PICTORIAL DOMESTIC BIBLE.

This useful Book is destined, if we can form an opinion from the Notices of the press, to have an unprecedented circulation in every section of our widespread continent, and to form a distinct era in the sale of our works. It will, no doubt, in a few years become THE FAMILY BIBLE OF THE AMERICAN PROPLE. PEOPLE

The most liberal remuneration will be allowed to all persons who may be pleased to procure subscribers to the above. From 50 to 100 copies may easily be circulated and sold in each of the principal cities and towns of the Union. IT WILL BE SOLD BY SUBSCRIPTION ONLY.

Application should be made at once, as the field will soon be occupied.

Persons wishing to act as Agents, and do a safe business, can send for a Specimen copy.

On receipt of the established price, Six Dollars, the Pictorial Family Bible, with a well bound Subscription Book, will be carefully boxed, and forwarded per express, at our risk and expense, to any central town or village in the United States, excepting those of Califondia, Oregon and Texas.

Register your Letters, and your Money will

come safe.

Orders respectfully solicited. For further particulars, address the subscriber (post paid).
ROBERT SEARS

181 William Street, New York.

EVERY READER will please notice the advertisement descriptive of MR. SEARS' PICTORIAL FAMILY BIBLE, and send for the Printed Catalogue of all our Illustrated Works.

To the UNINITIATED in the great art of selling Books, we would say that we present a scheme for money making which is far better then all the gold mines of California and Australia.

Any person wishing to embark in the enter-prise, will risk little by sending to the Publisher \$25, for which he will receive sample copies of the various works, (at wholesale prices) carefully boxed, insured, and directed, affording a very liberal per centage to the Agent for his trouble. With these he will soon beable to ascertain the most saleable andorder accordingly. Address (post paid)

#### DOUBLE SCREENED ROCKAWAY.

The Great Premium Fan still Victorious.

Invented and Manufactured by J. Montcomery & Bro., at No. 155 North High Street, Baltimore.—Patented Dec. 20th, 1853. and June 9th, 1855. This Fan has taken the first Premium at all the lead-

ing Agricultural Shows of Virginia, Maryland and North Carolina. We have never been beaten since we improved our Fan, and we do not think that there is any Fan in the United States that will do its work as fast and clean as our They are worked easy, are very Rockaway. simple, can be rigged for cleaning by an intelligent farmer, are very durable, and when out of order can be repaired with great ease by any mechanic, and they are adapted to cleaning all kinds of grain. We have had ample opportunities to test our Fan, during the present harvest, with several of the latest improved Fans, and our experience is, that we can clean nearly, if not quite, as fast and clean as any two of them in the same time. We think we know what the farmer wants and needs, and that our experience enables us to suit them better than any other person in the Fan business, and they may rest assured that no pains will be spared to give them the best machine in the market. Our Fan has gained its present popularity entirely in consequence of its merits-our sales have increased 50 per cent. in our old districts, showing that those sold heretofore have given full satis-We have sold over 550 Fans this seafaction. son, and 750 will not more than supply the demand from present appearances. It is an easy matter to puff up an article before the public, through the Journals as some have been this season, but for a Fan to retain its popularity, and to increase in demand, as ours has done in the same counties and districts for 3 and 4 years, is the best evidence of its value. Our sales are extended over six States, namely: Maryland, Virginia, North Carolina, South Carolina, Delaware and Georgia. Having secured Letters Patent for our Fan in 1853 and 1855, we are now prepared to sell Rights for any State or County We offer a good chance not mentioned above. to any enterprising mechanic who desires to go into business--a business that can be started on a small capital and yield as fair profit as any we know of. We will give all the Patterns and any instruction requisite.

Our Fans, delivered on board the vessel in Baltimore, cost \$34. All orders by mail as promptly attended to as if made in person.

It is deemed almost unnecessary to give certificates or references, as to the superior qualities of our Fan, as they are so universally known, but for the information of those who have not as yet used them. We subject the superior of the

We have tried Montgomery & Bro's improved Double Screened Rockaway Fan, and find it to be the best we have ever seen. It cleans cleaner, faster, and works better, in general, than any we have ever tried. We recommend it to all our friends.

John Wise,

Sam'l Carrington,
Joseph Young,
Jos. H. Cooksey.

This is to certify that I purchased of Messrs. J. Montgomery & Brother, one of their Wheat Fans, the 17th of July, 1852, and I consider it an excellent fan. It is now fanning wheat this day, and I think it is as perfect as when I first purchased it, except the usual wear and tear, I would recommend them to the public.

DAN'L NEWNAM.

ROCKFIELD, Nelson Co., July 23, 1855.

Messrs. J. Montgomery & Bro.

I am more than pleased with your Rockaway Fan; had I obtained yours in time on my last year's third and inferior qualitied wheat, (the remnant) I could have saved \$150.

H. N. COLEMAN, SR.

All orders addressed to the undersigned, at Baltimore City (Md.) Postoffice, will be promptly attended to. J. Monteomery & Bro.

SOUTHERN PLANTER - ADVISTING SHEET

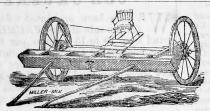

PIGS OF IMPROVED BREED FOR SALE.
I have for sale, to be delivered at weaning time, a good many pigs of improved breed. I have produced it myself from crosses of the Surry (or Suffolk) genuine Berkshire, (Dr. John R. Woods' stock) Irish Grazier, Chester County, no Bone and Duchess. I think them superior hogs of medium size, and for fourteen years they have not had a bad cross among them. I prefer that purchasers should view my brood sows and my boar on my farm, three miles below Rich-mond. I will not sell them in pairs, because the in-and-in breeding would depreciate the stock at once and cause dissatisfacton, but I will sell in one lot several of the same sex.

Price \$5 per head for one, and an agreed price for a larger number. They will be delivered on the Basin or any of the Railroad Depots

free of charge.

FRANK G. RUFFIN.

Summer Hill, Chesterfield, May, 1856.

# SEYMOUR'S

IMPROVED PATENT

# Broadcast Sewing Machine.

This Machine was patented in 1845, and ten years have proved it to be unequalled in the United States

for the purposes for which it is designed. It has but very little machinery, hence, when well made, it is very durable. It is capable of performing as follows: it sows correctly (and any desired quantity per acre,) all the various kinds of grain and seed commonly sown by farmers, from peas to the smallest seeds (Clover and Timothy mixed,) if desired, and all the fertilizers or manures of a dusty nature, which are so nearly reduced to a powder that the largest particles will pass through an aperture which will let through peas or corn, or which, having once been ground or made fine, and become lumpy by exposure, as plaster frequently does, can readily be reduced to powder by the action of the "plaster rod," which is a kind of coarse sheet iron saw, which is used in the machine, for dis tributing all such manures.

It is capable of dusting every inch of ground on an acre of land with less than half a bushel of plaster, and thirty or forty bushels of lime may be thus evenly applied to the same amount of land. It sows ten feet wide, and any narrower breadth may be sown at pleasure, merely with a "rod" with only teeth enough on to sow the breadth desired. It has received the highest recommendations from many hundreds of the best farmers of our country, and received twelve premiums from Agricultural Societies, besides the highest Prize and Diploma at the trial of Agricultural Implements,

held at Geneva, July, 1852.

[The following is from the Albany Cultivator of June, 1848, by the Editor, L. Tucker.]

"This cut represents Seymour's Sowing Machine advertised in our last. It has been extensively used in Western New York, and is much approved. We saw many acres of various kinds of grain on the farm of John Delafield, Esq., near Geneva, last season, which

had been sown with this machine, and we never saw grain stand more evenly on the ground. Mr. Delafield assured us he could sow anything-lime, plaster, poudrette, guano, &c., or any seed, from grass seed to peas, or Indian corn, with perfect exactness graduating the quantity per acre to a pint."

[Extract from an Address of the Hon. Geo. Geddes, before the Onondaga County Agricultural Society.]

The sowing of plaster by hand is a very unpleasant piece of hard work, and it is by far the best economy to use one of Seymour's machines. With these machines the plaster is evenly distributed over the whole ground and for this reason a smaller quantity of plaster is required to touch every part of the surface.

[From Ed. Southern Planter, Va., April, 1855.]

Seymours Patent Broadcasting Machine. - We again call the attention of our subscribers to this machine. Since the last number of the Planter was published we have sowed with it one hundred acres in oats, and they are now up. We never had a crop so well seeded or

that promised better.

As to the quantity of work it will do, we can only state our own experience. One horse works the ma-chine with perfect ease, it being no heavier than a single gig. The driver in our case, was so engaged that sun, and had to leave it about the same time in the evening. We had four three-horse harrows in the field and a three horse plough to sweep the water furrows. The land required only one harrowing to get it in order, the tilth upon the fall and winter ploughing being remarkably fine. Dividing the work of preceding and following the Machine, as occasion required, so as to keep all the work well up together, we found that it was perfectly able to keep ahead of them. It sows a breadth of ten feet as fast as a horse can walk, and carrying two bnshels at a time, does not require as many stoppages as are necessary with a man who seeds by hand and cau-carry a much less supply with him. The seeding, too, is entirely independent of the wind, and was done with us as well during very high winds, which prevailed most of the time, as during a calm, because the seed are delivered so close to the ground We not only recommend the machine, therefore, to every farmer, but we urge them to buy it, not on Mr. Seymour's account, who is nothing to us, but on their own.

Albemarle, Va., Marc I purchased one of Mr. Seymour's Plaste 1854, and it was used by myself and a neig ing thirty or forty tons of Plaster. in the fall of 1854, and am now using boil with an ordinary horse can sow, witho twenty to twenty five acres a day. The is as perfect as possible. I am certain that inch of an acre was dusted by one third My neighbor Mr. F. K. Nelson thinks he eff one peck. I cannot speak too highly of a as a plaster sower, It sows timothy seed I have not tried it with wheat, but feel as answer well. T. J. RAL

Fredericksburg, Va., Oct To Messis. Wellford, Eastham & Co. Gentlemen:-At your request I with plyou my opinion of Seymour's Patent Sowir which I have used with perfect satisfaction for past, in sowing wheat. I last year sowed these machines 300 bushels; it sows ten ! distributes the seed with perfect regularity face at any rate you may desire to the actity is indicated by an index, to which tached, and a small boy capable of filli wheat and driving so as not to vary track of the machine, can manage it as person. The grain is not affected by v think I can safely recommend the mac

cultural community. Very respectfully, your obedient They are all made under the supervision of the inventor, and it is intended that every machine shall be made as it should be; for we are well aware that if we allow bad work or materials, the evil is greater to ourselves than to the purchaser. The price with all improvements made previous to 1845, is \$55 In July. 1855, an improvement was patented which when applied increases the price to \$60. Since that time another very valuable improvements, the value of the machine to the purchaser is nearly or quite doubled, while the price is only increased to \$65. Another box, placed behind the wheels, will be turnished to order at \$25. With this, grain or seed may be sown while sowing some other seed or substance from the main box. This can be removed or replaced in five minutes.

Reference is made to all the Presidents of the New York State Agricultural Societies who have presided since 1845, and as they are in use by intelligent farmers in half the States in the Union, as well as in Canada, we would refer to all these gentlemen to testify to their ex-

cellence:
